The Savannah River Plant is a major installation for the production of nuclear materials for national defense. Approximately 8300 cu m (22 million gal) of high-level radio-active waste (HLW) are currently stored in tanks at the plant. The purpose of this study is to provide environmental input into both the selection of an appropriate strategy for the permanent disposal of the HLW currently stored at the plant and subsequent decision to construct and operate a Defense Waste Processing Facility (DWPF) at the Savannah River Plant site. The proposed DWPF would process the liquid HLW generated into a stable form for ultimate disposal. The HLW is composed of three components: an insoluble sludge 15%; a crystallized salt cake (60%); and a supernatant aqueous solution (25%). The preferred alternative for disposal of the HLW is geological disposal or long-term isolation in a mined geologic repostitory, with very deep hole and subseabed disposal being retained as backup technologies. The proposed DWPF will immobilize the waste into an appropriate form for placement in a repository. Three immobiliazation alternatives were analyzed in detail to show the possible range of environmental impacts associated with the construction and operation of a DWPF. All three immobiliaztion alternatives require the processing of the waste into two fractions: a high-level raioactivity fraction for immobilization and offsite geologic disposal and a partially decontaminated salt fraction for solidification and disposal as low-level waste on the site. The preferred alternative is the staged process alternative in which a facility to treat the sludge would be constructed first, and then a facility to treat the salt cake and supernatant would be constructed. EVALUATION OF IMPACTS ASSOCIATED WITH REREGULATION OF WATER LEVELS IN LAKE MOHAVE,
Lake Mead Limnological Research Center, Las Vegas.
J. R. Baker, and L. J. Paulson.
Technical Report No 4, March 1980. 23 p, 8 Fig, 4 Tab, 8 Ref. 14-06-30002218.

Descriptors: *Lake Mohave, *Reservoir releases, *Water level fluctuations, *Thermal stratification, *Fish populations, *Environmental effects, Hoover Dam, Recreation, Water temperature, Plankton, Hydroelectric plants, Reservoir operation, Reservoir fisheries, *Nevada.

The Water and Power Resources Service is considering reregulating Lake Mohave water levels to increase the net power benefit from Hoover Dam. By generating more power during those periods when energy has a higher market value, more net monitary benefit can be derived. To optimize power generation from Hoover Dam, water levels will fluctuate from elevations of 600 to 640 ft. The proposed alternatives will increase the instability of Lake Mohave, which in turn will affect every component of the biota. It is reasonably certain that the largemouth bass fishery will decline as a result of the reregulated water levels. The lower water will also tend to reduce the total carrying capacity of Lake Mohave for all types of fisheries. Fluctuating water levels and high Hoover Dam discharges, during low water levels, will increase the instability in Lake Mohave resulting in partial destratification and cooler water temperatures. Instability will produce changes in the plankton communities, but nuisance conditions will probably not occur due to increased turbulence and lower water temperatures. Cooler water temperatures can be considered a water quality problem because the total area in Lake Mohave available for water contact sports will be reduced. (Moore-SRC)
W82-06089

THE LIMNOLOGICAL STATUS OF LAKE MEAD AND LAKE MOHAVE UNDER PRESENT AND FUTURE POWERPLANT OPERATIONS OF HOOVER DAM,
Lake Mead Limnological Research Center, Las Vegas.
L. J. Paulson, J. R. Baker, and J. E. Deacon.
Technical Report No 1, January 1980. 229 p, 70 Fig, 27 Tab, 76 Ref. 14-06-300-2218.

Descriptors: *Lake Mead, *Lake Mohave, *Dam effects, *Reservoir releases, Limnology, *Pumped storage, Hydroelectric plants, Reservoir operation, Nutrients, Physical properties, Chemical properties, Plankton, Productivity, Environmental effects, Thermal stratification, Water temperature, Fisheries, *Utah.

Several proposed alternatives for modifying Hoover Dam to increase peak-power output would require a peak discharge in excess of current levels (25-30,000 cu ft/sec). Investigations were conducted on Lake Mead and Lake Mohave to assess the impacts of these power modifications on the limnology of the reservoirs. Temperature, oxygen, pH, conductivity, light, nitrogen, phosphorus, chlorophyll-a, phytoplankton productivity, and plankton species composition measurements were made monthly at 15 reservoir stations in Lake Mead and 5 in Lake Mohave. Nutrients were also measured monthly in the Colorado River at Pierce Ferry and below Hoover Dam and in Las Vegas Wash. Upgrading of existing generating units or addition of new units will require an increase in peak-discharge to 49,000 and 56,000 cu ft/sec and minimum flows of 2000 cu ft/sec. Alternating high and low discharge will cause an oscillation of the thermocline in Black Canyon, near the dam. At low lake elevations, warmer water will probably be pulled to the intake gates, increasing the temperatures of the discharge. The alternating high and low discharge will have the greatest impact on Lake Mohave. Thermal stratification will be disrupted, and the interface between river and reservoir water will shift down-lake under high discharge and up-lake at low discharge. Operation of a pump-storage unit at Hoover Dam will require a peak-discharge of 76,000 cu ft/sec, periods of no flow and reverse flows of 25,000 cu ft/sec. Fluctuations in temperature of the river, interspersed with periods of no flow will create problems for recreational use and fisheries in Black Canyon between Hoover Dam and Willow Beach. (Moore-SRC)

INFLUENCE OF DREDGING AND HIGH DISCHARGE ON THE ECOLOGY OF BLACK CANYON,
Lake Mead Limnological Research Center, Las Vegas.
L. J. Paulson, T. G. Miller, and J. R. Baker.
Technical Report No 1, 1980. 59 p, 16 Fig, 8 Tab, 33 Ref. 14-06-300-2218.

Descriptors: *Forebays, *Dredging, *Environmental effects, *Reservoir releases, *Productivity, Fish food organisms, Dam effects, Hydroelectric plants, Colorado River, Hoover Dam, Pumped storage, Periphyton, Invertebrates, Scour, Silting, Trout, Sucker, Chubs, *Black Canyon, *Utah.

The Water and Power Resources Service is considering dredging in Black Canyon to create a larger forebay to accommodate higher peak-discharges and reverse flows for proposed modifications to Hoover Dam, such as the addition of one or more conventional hydroelectric generating units, and the addition of reversible pump-storage hydroelectric units. The Black Canyon area supports a heavily utilized trout fishery and is important habitat for the razorback sucker and possibly bonytail chub. The food chain in Black Canyon is relatively simple and consists of a few invertebrate and fish species that are wholly supported by periphyton productivity occurring in the canyon. Dredging in the area above Ringbolt Rapids will significantly reduce periphyton and invertebrate productivity, and could reduce the trout and endemic fish populations because they are wholly dependent on these autochthonous resources for

food. Higher current velocities created by increased peak-discharges could have a mre permanent impact than dredging. Siltation occurs below the tailrace during low discharge periods. These materials are flushed downstream during peak-discharge periods and scour the bottom of periphyton and invertebrates. If dredging is conducted, consideration should be given to disposal of dredge spoils (cobble and boulder size) along the river banks in Black Canyon, since boulder and cobble substrate would probably enhance productivity. (Moore-SRC)

EVALUATION OF POSSIBLE TEMPERATURE FLUCTUATIONS FROM PROPOSED POWER MODIFICATIONS OF HOOVER DAM,
Lake Mead Limnological Research Center, Las Vegas.
J. R. Baker, and L. J. Paulson.
Technical Report No 3, March 1980, 23 p, 10 Fig, 2 Tab, 4 Ref. 14-06-30002218.

Descriptors: *Water temperature, *Dam effects, *Environmental effects, *Pumped storage, *Reservoir operation, Reservoir releases, *Hoover Dam, Hydroelectric plants, Lake Mead, Thermal stratification, Intakes, *Utah.

Planned alternatives for increasing the generation capacity of Hoover Dam to help meet peak power demands include uprating existing units, adding generating units, and adding reversible pumped-storage hydroelectric units. The upper intake gates (1045 ft), with few exceptions, have not been used since 1954, but with the addition of generating units or the installation of reversible pumped-storage units, one upper gate on the Arizona Tower would be used in conjunction with the four lower gates to facilitate the higher flows. In order to evaluate the effects of discharge rate from the upper and lower gates on temperature and temperture structure in Lake Mead, Hoover Dam was alternately operated from the four lower gates and four upper gates in sonsecutive 24-hour periods over the daily power cycles on 18-19 August and 22-23 August 1979. The rate of discharge had no obvious effect on discharge temperatures when either the lower or upper gates were used. The planned operation of using one of the upper gates in conjunction with the four lower gates will cause only a slight increase in discharge temperature. The cumulative effect of continual alternation of pumping and discharging with reversible pumped storage could substantially disrupt thermal stratification in Black Canyon and parts of Boulder Basin. ENVIRONMENTAL PROBLEMS AND GEOTHERMAL PERMITTING,
Windrem, Feeney and Williams, Lakeport, CA.
P. F. Windrem, and G. L. Marr.
Natural Resources Lawyer, Vol 14, No 4, p 675-685, 1982. 1 Tab, 58 Ref.

Descriptors: *Geothermal resources, *Legal aspects, Resources development, Natural resources, Geothermal power, Electric power production, Water law, *California, Geysers, Water quality, Water pollution sources, Environmental effects.

This paper describes the stages of geothermal development, the attendant environmental hazards, and the jurisdictions of the various government agencies. Most examples of environmental hazards are drawn from the electric power production in the geysers of northern California. Major environmental effects of geothermal development are observed on air quality, land (soil erosion, seismic activity and subsidence, wildlife habitat and visual quality), and water quality. In California development occurs on private lands, federal land, federal mineral reserve land, state land, and state mineral reserve land, each subject to different regulatory agencies. Geothermal development occurs in five stages: exploration, full field development, power plant construction, field operation, and field abandonment. Primary threats to water quality are sedimentation of streams from soil erosion caused by earth work, spills of liquid wastes such as drilling fluids and power plant steam condensate, and well casing failure. The most serious incidents of water pollution at the geysers in California have resulted from spills of steam condensate into nearby streams, caused by condensate pond overflow, condensate pipeline rupture, or reinjection problems. The pollution results from the toxicity of the waste water. A number of different agencies have jurisdiction over various aspects of the process. (Baker-FRC)

THE RELATIVE ABUNDANCE OF OPOSSUM SHRIMP, MYSIS RELICTA, IN TWIN LAKES, COLORADO USING A BENTHIC TRAWL,
Colorado Div. of Wildlife, Fort Collins.
T. P. Nesler.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-234493, Price codes: A03 in paper copy, A01 in microfiche. Bureau of Reclamation Report REC-ERC-82-3, September 1981. 25 p, 12 Fig, 5 Tab, 17 Ref.

Descriptors: *Shrimp, *Biological samples, *Sampling, Aquatic populations, Twin Lakes, *Pumped storage, Environmental effects, Benthos, Trawling, Seasonal distribution, *Colorado.

The study of the opossum shrimp (Mysis relicta Loven) at Twin Lakes, Colorado, is part of an investigation into the potential impacts of pumped-storage power generation on the two lakes. Since 1974, large and small benthic sled-type trawls have been used monthly to determine relative abundance of the shrimp. A comparison of the two trawls based on replicate sampling indicated that the mean shrimp density for the large trawl was 68% of the small trawl estimate. This difference was not statistically significant because of a large sample variation. An off-bottom sampling bias affected by the speed of the trawl was determined in a separate study using the small trawl. Corrections for this potential bias in the small trawl data collected in 1977 and 1979 indicated that shrimp densities may have been underestimated by 22 to 77%. Comparison of mean shrimp densities for the two trawl sizes using corrected small trawl data showed the large trawl estimate to be only 42% of the small trawl estimate. Shrimp length frequency analyses concur with this difference, indicating the smaller, juvenile shrimp were missed by the large trawl because of the larger mesh size. Adjusting for trawl sampling efficiency and sampling bias, yearly shrimp densities may have ranged from 88 to 348 shrimp/sq m in the lower lake and from 57 to 174 shrimp/sq m in the upper lake. This sampling variability precluded all but the most general comparisons of Mysis densities. Monthly estimates of shrimp densities in each of 4 years sampled showed a characteristic increase from June to September with declines in October and November in the lower lake. Over the 1974 to 1979 study period, seasonal mean estimates of shrimp density and indicated an increasing abundance of Mysis since 1975 in the lower lake, and a fluctuating population in the upper lake. TWIN LAKES STUDIES: A CHARACTERIZATION OF THE TWIN LAKES FISHERY VIA CREEL CENSUS WITH AN EVALUATION OF POTENTIAL EFFECTS OF PUMPED-STORAGE POWER GENERATION,
Colorado Div. of Wildlife, Fort Collins.
T. P. Nesler.
Bureau of Reclamation Report REC-ERC-82-4, November 1981. 56 p, 12 Fig, 28 Tab, 42 Ref.

Descriptors: *Environmental effects, *Trout, *Lake fisheries, Twin Lakes, *Pumped storage, Fish populations, Sport fishing, Recreation, Fishkill, Turbidity, Water level fluctuations, *Colorado.

Creel census data are presented for the period December 1976 to September 1979. The creel census studies have resulted in estimates of seasonal fisherman effort, harvest, and catch rates with a precision suitable for use in the detection of impacts from the operation of the Mt. Elbert Pumped-Storage Powerplant. For the 1973-79 summer seasons, total fishermen effort estimates ranged from 66,677 to 89,820 man-hours on the lower lake and from 19,721 to 29,139 man-hours on the upper lake. Harvests ranged from 19,955 to 32,496 fish on the lower lake and from 6411 to 12,457 fish on the upper lake. Fifty-four to 56% of the fisherman effort and harvest occurred on weekends. Rainbow trout composed 94% or greater of the summer harvests. For the winter seasons on the lower lake from 1974 to 1979, fishermen effort estimates ranged from 3900 to 8800 man-hours and harvest estimates ranged from 400 to 1200 fish. Lake trout composed 87% or greater of the harvests in most winter seasons. Potential powerplant impacts via increased mortality to rainbow trout, daily and seasonal water-level fluctuations, and shoreline turbidity may have the greatest negative impact upon the Twin Lakes shore fishery for rainbow trout. Because the estimates from the winter harvest, the boat fishery, and the monthly creel census for both shore and boat categories are less precise, only large-scale changes in these components will reflect statistical significance. Operation of the powerplant during the weekends in the summer may have a greater impact on fishermen effort if large-scale turbidity or fishskills are observed. (Moore-SRC)

COLORADO COOPERATIVE FISHERY RESEARCH UNIT STUDIES AT TWIN LAKES, COLORADO: 1980 REPORT OF FINDINGS,
Colorado Cooperative Fishery Research Unit., Fort Collins.
E. P. Bergersen, and M. Maiolie.
Bureau of Reclamation Report REC-ERC-82-8, December 1981, 66 p, 40 Fig, 2 Tab, 18 Ref, 1 Append.

Descriptors: *Environmental effects, *Water currents, *Limnology, *Trout, *Water level fluctuations, *Shrimp, *Suspended sediments, *Twin Lakes, *Pumped storage, Monitoring, Water circulation, Spawning, Fish eggs, Eutrophication, Vegetation, Productivity.

The objectives of these studies were to gather baseline data on the Twin Lakes system during the preoperational phase of the Mt. Elbert Pumped Storage Powerplant, and to develop aquatic environmental monitoring techniques suitable for use during post-construction operating periods. Natural, seasonal patterns in surface and bottom currents were characterized and documented in the two-lake system, to allow detection of changes in current patterns produced by the powerplant. Suspected shoreline spawning habitats were searched for lake trout eggs to a depth of 1.5 m in 1979 and 1980. Results indicate that it is unlikely that lake trout in Twin Lakes spawn in water less than 1.5 m deep, and thus the expected daily water fluctuation of 0.7 to 1.1 m should not result in the exposure of lake trout eggs. A photographic method of estimating Mysis shrimp populations was developed. Shrimp are at least 2.4 times as abundant in Twin Lakes as previously thought, with densities in the vicinity of the powerplant as high as 232 shrimp/sq m. Both sediment traps and inflow/outflow suspended sediment sampling were used to estimate sedimentation rates in Twin Lakes. Estimates from these two methods differ greatly. The best time to monitor impacts on sediment movement and deposition would be during the winter months. Potential input to the energy budget from inundated terrestrial vegetation was estimated to be over four times the average annual primary productivity of the system. (Moore-SRC)

ENVIRONMENTAL ASSESSMENT; GEOTHERMAL DIRECT HEAT PROJECT; MARLIN TEXAS.
Department of Energy, Washington, DC.

LIBRARY U. OF I., URBANA-CHAMPAIGN

Available from the National Technical Information Service, Springfield, VA 22161 as DOE/EA-0117, Price codes: A04 in paper copy, A01 in microfiche. Report DOE/EA-0117, August 1980. 68 p, 11 Fig, 14 Tab, 10 Ref, 2 Append.

Descriptors: *Geothermal resources, *Environmental effects, *Wastewater disposal, *Brazos River, Wells, Water quality, Groundwater pollution, Water pollution sources, Thermal pollution.

The project construction activities consist of well drilling, pipeline construction, heating system modification, and fluid disposal provision for the Torbett-Hutchings-Smith Memorial Hospital to provide an environmentally acceptable, operational geothermal space heating and hot water system. It was necessary to drill one supply well in order to confirm the reservoir and to obtain fluids for analysis in order to assess the environmental effects of fluid disposal. Fluid from operation will be disposed of by discharging it directly into existing street drains, which will carry the fluid to Park Lake and eventually the Brazos River. The spent fluids will be discharged at approximately 50 C and at a maximum of 13 l/s. It is anticipated that because of the utilitarian nature of the City Park Lake, Bean Branch and McCullough Slough; the long-term public use and acceptance of Marlin geothermal waters for bathing and drinking purposes; and the fact that these bodies of water are not used for irrigation, the geothermal discharge will not require pretreatment. No significant effects on water quality in the project area are expected during operation. At minimum flow rate for the Brazos River, the maximum discharge of geothermal water (25 l/s) will increase the river's flow by only 0.26%. The possibility of contamination of aquifers will be minimized through careful design and construction of the well. Depletion or subsidence problems are not likely to occur. The proposed drilling site is in a developed urban area, so no disturbance of natural vegetation or wildlife habitat will occur. (Moore-SRC)

ENVIRONMENTAL ASSESSMENTAL, GEOTHERMAL ENERGY, HEBER GEOTHERMAL BINARY-CYCLE DEMONSTRATION PROJECT; IMPERIAL COUNTY, CALIFORNIA.
Department of Energy, Washington, DC. Div. of Geothermal Energy.
Report DOE/EA-119, October 1980. 314 p, 25 Fig, 18 Tab, 173 Ref, 9 Append.

Descriptors: *Geothermal power, *Environmental effects, *Cooling water, *Injection wells, Wastewater disposal, Irrigation-return flow, Powerplants, Water use, Effluents, Salt drift, Thermal pollution, Irrigation water, Blowdown.

The power plant will utilize a simple binary conversion process consisting of three fluid loops: a geothermal fluid loop, a hydrocarbon working fluid loop, and a cooling water loop. The geothermal well field will consist of a production island with 13 production wells and an injection island with 7 injection wells. A mechanical draft cooling tower using approximately 8.8 cu m/s of cooling water will be utilized. Approximately 0.22 cu m/s of make-up water is required by the project. Water for the first five years of operation will be Colorado River irrigation water obtained from the Imperial Irrigation District. After the initial five years of operation, water will be obtained from the New River, irrigation return flows, or both. The geothermal resource to be developed is located at a depth of 610 m to 3048 m. The available resource is estimated to be 17 cu km at temperatures ranging from 165 C to 182 C. The principal effluents are salt drift and blowdown released from the cooling tower. Geological impacts resulting from the project are gradual reservoir depletion, and displacement of prime farmland soils. Hydrological impacts result from water depletion, effluent discharge, and thermal enrichment. These impacts will be mitigated by compliance with California Regional Water Quality Control Board permit requirements. (Moore-SRC)

GOWANUS CREEK CHANNEL; BROOKLYN, NEW YORK; REVIEW OF REPORTS (SURVEY); MAIN REPORT AND ENVIRONMENTAL IMPACT STATEMENT.
Army Corps of Engineers, New York.
Report, September 1981. 81 p, 6 Fig, 10 Tab, 25 Ref.

Descriptors: *Dredging, *Channel improvement, *Waterways, *Environmental impact statement, Oil spills, Turbidity, Estuaries, Environmental effects, Sediments, Fish migration, Water quality, Water pollution control, *New York, Gowanus Creek Channel.

The 30 ft mean low water existing Federal navigation channels in Gowanus Creek, Brooklyn, New York, are not deep enough to allow present deep draft and other large ocean-going vessels to use them in a fully loaded condition. The recommended plan consists of deepening the channels to 35 ft below mean low water. Additional dredging from 35 to 40 ft may be accomplished at non-Federal cost. All material would be disposed of in a sanitary land fill in Fresh Kills, Staten Island. The dredging will significantly reduce present navigation problems in this waterway, with minimal adverse environmental impact and an overall net improvement due to removal of polluted bottom sediments from the aquatic environment. It will also reduce the occurrence of oil spills by reducing the lightering of petroleum products. Since Gowanus Creek Channel is impoverished in aquatic and benthic life, and because the surrounding area is devoted to shipping and industrial activities, the environmental impact of dredging will be minimal. An increase in turbidity in Gowanus Bay may marginally interfere with fish migrations. The impact of dredging on the Hudson fishery will be reduced if dredging activities are limited to the late autumn or early winter. Indications are that there will be no change in the tidal dynamics of the creek. (Moore-SRC)

HABITAT RECOVERY IN THE NORTH FORK OF THE TETON RIVER.
Soil Conservation Service, Boise, ID.
Report, March 1982. 98 p, 23 Fig, 14 p, 34 Ref, 2 Append.

Descriptors: *Channeling, *Stream stabilization, *Environmental effects, *Flood damage, *Aquatic habitats, Invertebrates, Dam failure, Species diversity, Irrigation water, Trout, Productivity, *Idaho, Teton River.

Teton Dam collapsed on June 5, 1976, while it was being filled for the first time. The North Fork of the Teton River was badly damaged by the flooding. In August 1976, water was diverted from the North Fork to facilitate the clean-up operation and restore its capacity for carrying flood flows. The stream-bed remained dry until mid-December when the temporary diversion dam was removed. A study was initiated to determine the effect of the Teton Dam flood and subsequent channel dewatering and channelization on the North Fork. Four stations in the North Fork were established as routine sample locations, plus one station in the main river. Examination of the data on total numbers of benthic invertebrates indicates that at least some parts of the North Fork have recovered. Its failure to do so at one station is due to excessive withdrawal for irrigation and not to factors associated with the flood. Data on the number of taxa suggested that only one station on the North Fork had fully recovered in terms of richness and that the other stations support 8 to 26 taxa fewer than would be expected. Values for richness and diversity did not peak until the second year at the downstream stations. There are steps which could have been taken as a part of the channel rehabilitation project which would have enhanced the rate of recovery and level of productivity. Failure to do so has prevented recovery of this portion of the river even three years later, and the attainment of its full potential as a productive trout stream. (Moore-SRC)

REREGULATION ON AN INTERNATIONAL RIVER--A CASE STUDY,
Department of the Environment, Dartmouth (Nova Scotia). Inland Waters Directorate.
J. E. Peters, and L. J. Bergen.
Journal of the Water Resources Planning and Management Division, Proceedings of the American Society of Civil Engineers, Vol 108, No WR2, p 217-233, June, 1982. 4 Fig, 8 Tab, 4 Ref.

Descriptors: *Reservoir operation, *Environmental effects, *Hydroelectric plants, Reservoir releases, St. Croix River, New Brunswick, Maine, Water supply, Rivers, Water use, Shores, Erosion, International Joint Commission, Spednic Lake, Flow regulation, Water level fluctuations, Fish, Wildlife, Attitudes, Public opinion, Model studies, Georgia Pacific Corporation, Vanceboro Dam.

The St. Croix River, which straddles the international border between Maine and New Brunswick, was the scene of water use conflicts in the early 1970's. Residents and camp owners on Spednic Lake complained about adverse effects of hydropower practices on recreation, water supplies, and shorefront properties. Among the problems cited were wrecking of boats on boulders during low water, reduction in fish numbers, poor access to the lake during low water periods, serious bank erosion, debris accumulation, dry wells in summer, and unreliable flows downstream of the dam. The International Joint Commission initiated studies to determine the effects of changes in the level of Spednic Lake and the flow fluctuations immediately downstream of the lake's impoundment, Vanceboro Dam. The system is operated by the Georgia Pacific Corporation for hydroelectric power production. The study included a public attitude survey, modeling of alternative operating procedures, and an independent study by the Georgia Pacific Corporation's consultants. A new operating procedure based on a rule curve was agreed upon. This guarantees certain minimum flows and lake levels near to the desirable summer level of 378.5 ft. Provisions were made to store sufficient water to compensate for a loss of capacity in a thermal plant in the system. The new operating procedure produces more favorable summer water levels in the lake and higher streamflows for water quality and fish. No major complaints from the public of government agencies have been received since the new operating policy has been instituted. (Cassar-FRC)

THE LANDSCAPE OF RUTLAND WATER,
S. Crowe.
Hydrobiologia, Vol 88, No 1-2, p 43-46, March, 1982.

Descriptors: *Reservoir, *Water supply, *Land management, *Design criteria, *Planting management, Drawdown, Land use, Zoning, Land resources, Forest management, Forest watersheds, Recreation, Wilderness areas, Water sports, Rutland Water, England.

Landscape problems encountered at Rutland Water included reconciliation of the reservoir and its works with the rural surroundings, siting and treatment of all ancillary works, mitigation of exposure of shore line by drawdown, provision of opportunities for recreation without damage to the environment, and nature conservation. The means adopted to solve these problems were forward planning, consultation with all interests concerned, extensive planting of native species, and arrangemens for appropriate maintenance. The landscaping process began with an extensive survey of the character of the site. Fortunately, reservoir topography resulted in a diversified shape of acceptable scale. Special attention was paid to avoiding incongruities caused by drawdown, and long dam, the pumphouses, and the canalized stream below the dam. To minimize time and cost of maintenance, most of the perimeter land is either grazed by sheep or maintained as woodland. (Titus-FRC)

POWER PLANT SITING,

Ebasco Services Inc., Greensboro, NC.
N. R. Tilford.
Bulletin of the Association of Engineering Geologists, Vol 19 No 2, p 187-196, 1982. 4 Tab.

Descriptors: *Site selection, *Powerplants, *Decision making, Nuclear powerplants, Hydroelectric plants, Electric powerplants, Water use, Water requirement, Thermal pollution, Environmental effects, Pumped storage, Water pollution effects, Reservoirs, Cooling water, Land use, Flood forecasting, Aquatic life, Licenses, Dams.

Water is the main requisite involved in siting any powerplant, hydroelectric, nuclear, or fossil-fueled. The ideal hydroelectric plant is located close to consumers in a high narrow gorge immediately downstream from a large valley. The best rock formations are massive, strong, and impermeable. Pumped storage facilities should meet the same requirements as the primary reservoir, but the effects of the daily or weekly filling and draining cycle must be considered. Cooling water is important in fossil-fueled electric plants, particularly coal-fired plants. For example, a 600 MW coal-fired plant uses 20 cu ft of water per sec. This water is returned to the biosphere at temperatures 8-15 F above ambient intake temperatures, possibly causing unfavorable environmental effects. Other siting factors for a coal-fired plant are transmission distance, fuel handling facilities, and waste disposal space. A method for siting electric plants is introduced. This is based on a series of criteria: exclusion criteria, avoidance criteria, and prefeence criteria, which can be applied to any geographical area. The system is weighted to help quantify the many subjective decisions. The procedure is illustrated in an evaluation of a nuclear power plant site. Candidate sites are graded on a scale of 100 with respect to engineering cost related items, nuclear licensing considerations, and environmental considerations. Among the water-related factors in the nuclear licensing category are meteorology, relative weight, 10% of total; hydrology, 10%; and depth to groundwater (a consideration under geology and seismology), 60%. Environmental considerations include aquatic ecology, relative weight, 35%; terrestrial ecology, 15%; ocean hydrogynamics, 35% (including heat dispersion capability of a water body and recirculating potential), and fresh water use, 15%. A numerical score derived for each site allows easy ranking of possible sites. (Cassar-FRC)

COLORADO RIVER ENHANCED SNOWPACK TEST ENVIRONMENTAL ASSESSMENT AND DESIGN PHASE FINDING OF NO SIGNIFICANT IMPACT,
Bureau of Reclamation, Denver, CO. Div. of Atmospheric Resources Research.
E. R. Harris.
Report, April, 1981. 39 p, 1 Fig, 18 Ref.

Descriptors: *Cloud seeding, *Snowpack, *Environmental effects, *Water yield improvement, *Colorado River Basin, Orographic precipitation, Weather modification, Water resource development, Streamflow, Runoff, Flood control.

The action proposed is to seed winter storm clouds in the Rocky Mountains of the Colorado River Basin to increase snowpack, runoff, and streamflow, thereby providing increased water yield to help meet future resource demands. Proposed alternatives include: no action: a 10-year program, with an initial 5-year phase for tests in two subbasins followed by a 5-year randomized seeding program; an 8-year program in which the initial phase is reduced to 3 years; and a 6-year program with a 2-year initial phase followed by a 4-year second phase. In each of the cloud seeding options, the initial phase involves installation of meteorological and hydrological observation and data collection networks. Seeding opportunity, climatological studies, seeding mode studies, and ground-based seeding studies would be included in the initial phase for the 10-year and 8-year options. No significant impact is expected from the initial phase. Each of the three cloud seeding options includes a second, randomized demonstration phase. An operational winter cloud seeding program could result in a 10 to 15% percipitation increase. Avalanche conditions and flood hazards will be included in suspension criteria for this project. It is expected that the use of seeding agents in this precipitation management research will have no environmental impact. A Finding of No Significant Impact for the Design Phase of the Colorado River Enhanced Snowpack Test is included. (Moore-SRC)

The North Caspian Sea and the Volga, Ural, and Terek basins should be considered as a single biome for the purposes of water management, according to a review of published data. Factors affecting fish reproduction and growth and allowing water regimes to achieve optimum development of fisheries are discussed. In the Volga delta the regulation of river runoff has changed the location and character of the fish spawning grounds, has caused the dates of the maximum and the end of the flood cycle to occur significantly earlier, has lowered the temperature of runoff, and has significantly decreased the abundance of fish caught in the region. In the North Caspian Sea salinity regimes are affected by river regulation. Productivity of the deep zones increases during wet years, and productivity in the shallow zone increases during dry years. Proper operation of the water distributor at the apex of the Volga delta is suggested for regulating the ecosystems in this region. This would increase freshening of the North Caspian waters and preserve the habitat for the brackish water complex of fish. Although operating the distributor disturbs the sturgeon migration, the author feels that these problems can be solved by fish passages, large scale transportation of spawners upstream, and changing the balance of releases between eastern and western parts of the Caspian. River regulation has also changed the physical nature of the Volga delta and lowered the level of the Caspian Sea. The number of distributary channels has doubled since 1912, reducing current velocity, increasing siltation and shoaling, salinizing the estuarine nearshore zone, and destroying connections between the sea and some fishways. Specific suggestions for improving the flow to the eastern fishways of the Volga are given. These include construction of additional canals. (Cassar-FRC)

LEAK LOCATION ENTERS COMPUTER AGE,
New York City Dept. of Environmental Protection, Bureau of Water Supply.
D. S. Greeley.
American City and County, Vol 97, No 5, p 14, 17, 18, May, 1982. 3 Fig.

Descriptors: *Water conservation, *Leakage, Water loss, *New York City, Measuring instruments, Water distribution.

With drought conditions facing New York, the city turned to the use of a computerized leak detection patrol to stop wastage of valuable water. After it had been in use for one year, the method had located some 43 mgd in leaks. When the first mobile leak detection van arrived in December of 1980 the manufacturer provided an intensive classroom training session to familiarize the laborers with the New York City water supply system, fundamentals of leak detection, and the principle behind the leak location system. The equipment provided so useful that three more leak detection vans were purchased in June of 1981 as the drought conditions intensified. The leak detection unit is about the size of a portable radio and allows a surveyor to listen to live valves, hydrant valves, and service lines along a water main. When a leak noise is picked up, the surveyor brackets the leak by identifying the points of maximum noise on the main. He then marks the distribution system map and continues surveying. The maps of each surveyor are referred to a follow-up crew in a leak detection van which wires the transducer connections into the console inside the van. By use of a microprocessor and oscilloscope and knowing the diameter of the water main the operator in the van can pinpoint the precise location of the leak. The savings of 43 mgd represented more than 500 leaks. (Baker-FRC)

WATER-QUALITY ASSESSMENT OF CACHE CREEK, YOLO, LAKE, AND COLUSA COUNTIES, CALIFORNIA,
Geological Survey, Menlo Park, CA. Water Resources Div.
S. K. Sorenson, and A. L. Elliott.
Geological Survey Open-File Report 81-677 (WRI), July 1981. 41 p, 14 Fig, 1 Plate, 2 Tab, 34 Ref.

Descriptors: *Water quality, *Water quality standards, *Data collections, *Water supply, Water use, Surface water, Streamflow, Suspended sediments, Sampling, Monitoring, Sites, Dissolved oxygen, Pesticides, Potential water supply, *California, Cache Creek, Clear Lake, Yolo Bypass.

Cache Creek and its tributaries from Clear Lake to Yolo Bypass have been the subject of quality and quantity of water studies by several governmental agencies since the early 1900's. Water-quality data from these studies showed that water in the basin is of good quality for most of the beneficial uses defined by the California State Water Resources Control Board. Concentrations of dissolved constituents are substantially higher in the water in the two largest tributaries than in Cache Creek. Seasonal variations in dissolved constituents are also greater in the tributaries than in Cache Creek. Clear Lake has a major effect on water quality, resulting in little seasonal fluctuation in water quality in Cache Creek. Excessive voron and suspended-sediment concentrations are the greatest water-quality problems, according to existing data. Both of these problems are from natural sources. Water-quality monitoring is presently being conducted monthly at four sites by the California Department of Water Resources and at several other sites by other agencies. Modifications in current monitoring are proposed to gain further information on diel dissolved-oxygen cycles, pesticides, and bio-

7B. Data Acquisition

LIQUID LEVEL INTERFEROMETER,
Arizona Univ., Tucson. Optical Sciences Center.
S. F. Jacobs, and J. G. Small.
Applied Optics, Vol 20, No 20, p 3508-3513, October, 1981. 10 Fig, 6 Ref. OWRT A-091-ARIZ(2).

Descriptors: *Interferometry, *Water level recorders, *Water level fluctuations, *Evaporation rate, *Measuring instruments, Lasers, Water level, Water loss, Reservoirs, Design criteria, Sensors, Reservoir evaporation, Field tests, On-site tests, Ponds.

An inexpensive field instrument was designed and constructed to measure changes in water levels, appropriate to ponds and reservoirs, to an accuracy of lambda/8. A novel magnetic suspension is used to position the floating retroreflector of the laser interferometer. Direction-sensing is achieved by dual optical channels phased near quadrature by means of an absorbing beam-splitter. Field measurements were made for an open pond having a surface area of about 600 sq. m. A typical recording of evaporation over a 36-hour period is shown, including the detection of a brief period of precipitation. Using an electric fan blowing across 0.1 sq. m of water in a laboratory test, an evaporation rate in the order of one micron/minute was measured. By measuring the slopes of a 4-day recording, a record of evaporation rate was determined as a function of time of day: in addition to the expected midday peak, reproducible peaks (possibly due to morning and evening winds) were observed in the morning and evening. The laser was an inexpensive He-Ne laser which produces multiple longitudinal modes which reduce fringe contrast for large unequal paths of the interferometers arms. The instrument achieves 0.08 micron sensitivity despite moderate water turbulence, possesses directional sensing, and includes a measurement of its own temperature for thermal expansion correction. EVALUATING NEAR-SURFACE SOIL MOISTURE USING HEAT CAPACITY MAPPING MISSION DATA,
Texas A and M Univ., College Station. Remote Sensing Center.
J. L. Heilman, and D. G. Moore.
Remote Sensing of Environment, Vol 12, No 2, p 117-121, 1982. 1 Fig, 3 Tab, 11 Ref.

Descriptors: *Remote sensing, *Soil water, *Soil temperature, Satellite technology, Heat Capacity Mapping Mission, Mapping, Vegetation effects, Soil types, Land use.

Heat Capacity Mapping Mission (HCMM) data were analyzed to determine their suitability for estimating near-surface soil moisture in a complex agricultural landscape with several soil types and crop types. The area monitored was a 8 x 24 km section of the Big Sioux River Basin, South Dakota. The HCMM radiometric temperatures did not correlate with soil water content for the four dates analyzed (June 5, July 13, August 8, and September 4, 1978). There was a mixture of land uses and soil covers within each pixel. However, when soil surface temperatures were empirically estimated from HCMM temperatures and percentage cover of each pixel, a highly significant correlation was obtained between estimated soil temperature and near surface soil water content. PORTABLE WATER ELEVATION MEASURING GAGE,
Bureau of Reclamation, Denver, CO., Engineering and Research Center.
M. Gutierrez.
Report GR-81-14, September 1981. 31 p, 8 Fig, 3 Tab, 10 Ref.

Descriptors: *Monitoring, *Groundwater level, *Water measurement, *Groundwater availability, *Well discharge, Salinity, Water level, Well casings, Recharge, Permeability.

One of the initial activities usually undertaken in ground-water investigations is an inventory of existing ground water availability and collection of water in wells. A portable system was developed for continuously monitoring the water elevation in wells by measuring the capacitance of an insulated wire placed in the water. The gage provides continuous readout, fast response to water elevation changes, and insensitivity to internal pressures. There is no effect on readings because of cascading water action. The gage can be initialized to read zero at various water elevations, and readings are not affected by water salinity. Results from a limited amount of testing indicate the feasibility of the measuring gage. The well under test had flaws in the well casing, and these irregularities of the well casing are shown in the test results. The detection of these irregularities led to speculation on other possible applications for the measuring gage in soil permeability testing and in detection of fractures in concrete and rock. Three methods for groundwater measurement are possible using this instrument: measurement of well discharge by water withdrawal or by disperson using air pressure in the well casing; measurement of the recharge rate after withdrawal of water; and measurement of the water elevation of normal conditions. (Moore-SRC)

A RAIN ATTENUATION MODEL FOR THE SIRIO-SHF EXPERIMENT,
Centro Studi Telecommunicazioni Spaziali e Politecnico, Milan (Italy).
G. Drufuca, and G. Macchiarella.
Atmosphere-Ocean, Vol 20, No 1, p 69-75, 1982. 4 Fig, 12 Ref.

Descriptors: *Remote sensing, *Rainfall rate, *Rainfall intensity, Precipitation intensity, Spina d'Adda, Italy, Radar, *SIRIO-SHF experiment, Model studies, Rain attenuation, Storms.

A model of rain attenuation, a bidimensional version of the snythetic storm technique, was developed and successfully tested by comparing the attenuation probability distribution from a year of measurements at 11.6 GHz and 32 degree elevation angle at the Spino d-Adda, Italy, receiving station with the rainfall rates measured at that station. Two different vertical rain profiles (rectangular and trapezoidal) reproduced the attenuation statistics, but each showed a different dependence on elevation angle, depicted on a graph for elevation angles from 5 to 45 degrees. Both models predicted lower attenuation than did the cosecant law for small elevation angles and higher attenuation for elevations above 30 degrees, particularly for the trapezoid model. (Cassar-FRC)

THE OUTLOOK FOR PRECIPITATION MEASUREMENTS FROM SPACE,
National Aeronautics and Space Administration, Greenbelt, MD. Goddard Space Flight Center.
D. Atlas, J. Eckerman, R. Meneghini, and R. K. Moore.
Atmosphere-Ocean, Vol 20, No 1, p 50-61, 1982. 2 Fig, 21 Ref.

Descriptors: *Remote sensing, *Rainfall, *Measuring instruments, Radar, Precipitation, Storms, Microwaves, Infrared imagery, Meteorology, Radiometry, Sampling.

The visible/infrared techniques, microwave radiometry, and radar can help in obtaining useful precipitation measurements from space. No single instrument or method currently satisfies the two requirements: adequate spatial and temporal sampling of the storm and sufficient accuracy in precipitation intensity estimates. The visible/infrared instruments provide good temporal sampling and rain area depiction. Microwave obtains quantitative rainfall estimates. Radar can overcome the inadequacies of microwave radiometric measurements over land. The accuracy, dynamic size, and system implementation of several radar methods are discussed: modified altimeter (simplest, least costly, but restricted to nadir measurements), short wavelength scanning radar (can scan cross-track to provide a swath measurement), surface target attenuation radar or STAR (variations include the surface comparison and the frequency agility methods), and the adaptive pointing beam. A hybrid approach that combines the surface reference technique (STAR), the frequency agility system, the short wavelength reflecting schemes, the adaptive pointing approach, and microwave radiometry may be a starting point in development of a suitable system. (Cassar-FRC)

TWO TECHNIQUES FOR LOCATING AND SAMPLING BROWN TROUT MICROHABITAT UNDER COMPLETE ICE COVER,

Wyoming Univ., Laramie. Water Resources Research Inst.
D. L. Wichers, T. A. Wesche, L. S. Johnson, and J. A. Gore.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-256777, Price codes: A03 in paper copy, A01 in microfiche. Water Resources Series Report No 83, May 1982. 48 p, 7 Fig, 2 Tab, 25 Ref. OWRT B-038-WYO(3), 14-34-0001-8130.

Descriptors: *Trout, *Aquatic habitats, *Fish migration, *Telemetry, Radiometry, Radioisotopes, Radioactivity, Radioactivity techniques, Antimony, Microenvironment, Wildlife habitats, Environment, Fish behavior, Fish populations, Remote sensing, Sensors, Ice cover.

Two techniques were devised and evaluated for locating and sampling instream brown trout microhabitat under complete ice cover conditions. Radiotelemetry (RT) using surgically-implanted transmitters (SIT) was superior to implantation of radioisotope (antimony-124) capsules for tracking under-ice movements and locating microhabitat locations. The wax-acrylic coated transmitters (15-20g) were about 2.2 inches long, and had a lifespan estimated at 6 months. Fish could be located/tracked by a receiver by walking on the ice or by flying at 500-1000 feet above the ice. The advantages of the RT method were that the use of SIT does not present a potentially hazardous situation, that locating implanted fish by RT is unimpaired by severe weather, and that signals could be sensed up to 200 m and were unaffected by water depth, ice, snow, dense undercut banks, and temperature. The major problem with SIT was battery failure. Measurements of trout movements under ice cover indicated that freezing water temperatures significantly decreased trout activity. Trout preferred to remain within focal areas as resting microhabitats, with their activity decreasing as winter conditions progress. The microhabitat preference data developed should assist recommendations of suitable winter instream flows for medium-sized trout streams which develop total ice cover during winter. COMPARISON OF AUTOMATED SATELLITE SYSTEMS WITH CONVENTIONAL SYSTEMS FOR HYDROLOGIC DATA COLLECTION IN WEST-CENTRAL FLORIDA,
Geological Survey, Tallahassee, FL. Water Resources Div.
W. M. Woodham.
Available from OFSS, USGS Box 25425, Fed. Ctr. Denver, CO 80225 Paper copy $3.50 Microfiche $3.50. Open-File Report 81-1180, 1982. 23 p, 3 Fig, 5 Tab, 1 Ref.

Descriptors: *Hydrologic data collections, *Telemetry, *Remote sensing, *Data transmission, Monitoring, Sites, Satellite technology, Comparison studies, Cost analysis. *Florida, West-central Florida, GOES, Southwest Florida Water Management District.

This report provides results of reliability and cost-effective studies of the goes satellite data-collection system used to operate a small hydrologic data network in west-central Florida. The GOES system, in its present state of development, was found to be about as reliable as conventional methods of data collection. Benefits of using the GOES system include some cost and manpower reduction, improved data accuracy, near real-time data availability, and direct computer storage and analysis of data. The GOES system could allow annual manpower reductions of 19 to 23 percent with reduction in cost for some and increase in cost for other single-parameter sites, such as streamflow, rainfall, and ground-water monitoring stations. Manpower reductions of 46 percent or more appear possible for multiple-parameter sites. Implementation of expected improvements in instrumentation and data handling procedures should further reduce costs. (USGS)

AIRCRAFT REMOTE SENSING OF SOIL MOISTURE AND HYDROLOGIC PARAMETERS, CHICKASHA, OKLA., 1980 REPORT,
Agricultural Research Service, Beltsville, MD. Hydrology Lab.
T. J. Jackson, P. E. O'Neill, G. C. Coleman, and T. J. Schmugge.
Agricltural Research Results ARR-NE-14, July, 1982. 18 p, 4 Fig, 6 Tab, 2 Ref.

Descriptors: *Remote sensing, *Soil water, *Hydrologic data, *Aerial photography, *Infrared imagery, Agricultural hydrology, Soil temperature, *Oklahoma.

The study sites in Oklahoma were in the Washita River Experimental Watershed, Chickasha area. Data flights were made and ground samples collected on June 24, August 14, and September 9, 1980. Soil moisture samples were collected using a gravimetric technique for depth intervals of 0-2.5, and 5-15 cm. Soil temperature samples were obtained at depths of 2.5 and 15 cm. The NASA 929 (C-130B) aircraft was the sensor platform used in these experiments. The sensor configuration included color infrared photography, a modular multispectral scanner, a thermal infrared radiometer, L and C band radiometer, a passive microwave scanner, and four active microwave sensors (K, C, L, and P band scatterometers). Generally the soil moisture conditions were relatively wet on the date of the first flight and very dry on the last two flights. These results were ideal because the wet condition data provided verification of the sensor performance in 1978 and the dry condition data allowed the extension of the 1978 data set. The report includes soil moisture measurements, climatic observations, and the remote sensing data collected in order to evaluate aircraft remote sensing techniques. (Moore-SRC)
W82-06969

APPLICATION OF THERMAL INFRARED IMAGERY TO CANAL LEAKAGE DETECTION,
Kansas State Univ. Manhattan. Dept. of Geography.
M. D. Nellis.
Remote Sensing of Environment, Vol 12, No 3, p 229-234, 1982. 4 Fig, 4 Ref.

Descriptors: *Canal seepage, *Leakage, *Remote sensing, Infrared imagery, Conveyance structures, Water conveyance, Seepage, Aircraft, *Oregon, North Unit Irrigation District, Soil water, Irrigation canals, Water loss.

Canal leakage sites were detected by a HRB Singer AN/AAS 14 optical-electronic thermal infrared scanning system, sensing in the 8-14 micron range. The apparatus was flown in an aircraft on May 21, 1979, at 2100 hours and 900 m altitude over the main North Unit Canal in central Oregon. Moist sites emitted more radiation during the evening hours and less during peak solar radiation hours than the low moisture, or nonleaking sites. Out of 39 sites showing the characteristics of leakage sites, 12 were verified as actual leakage sites by field analyses. Inspection of the canal uncovered no leakage sites not appearing on the imagery. The sites misinterpreted as leakage sites featured dense natural vegetation, farm canals, drainage ditches, small holding ponds, or natural depressed drainage areas. This interference could be reduced by taking simultaneous color photographs. This economical and practical leakage detection method could help save some of the 58,800 acre feet (or 1 acre-ft per acre of irrigated land) 0.6-7.3 m, and lengths were 12.2.-91.4 m. 75% were oblong in shape, and the remainder were irregular. (Cassar-FRC)
W82-06994

ESTIMATION OF THE PRECIPITABLE WATER FROM THE IR CHANNEL OF THE GEOSTATIONARY SATELLITE,
Meteorological Satellite Center, Tokyo (Japan).
T. Aoki, and T. Inoue.
Remote Sensing of Environment, Vol 12, No 3, p 219-228, 1982. 8 Fig, 1 Tab, 15 Ref.

Descriptors: *Remote sensing, *Atmospheric water, *Precipitable water, *Infrared imagery, *Pacific Ocean, *Geostationary Meteorological Satellite, Seasonal variation, Meteorology, Water vapor,Marine climates, Air temperature, Water temperature, Temperature, Satellite technology, Tropical regions.

Total precipitable water over the tropical oceans was determined from infrared radiometer data in the atmospheric window region using data from the Geostationary Meteorological Satellite of Japan. The information about sea surface temperature, atmospheric temperature, and atmospheric water vapor involved in the observed radiation in the atmospheric window region varied greatly with the amount of water vapor in the atmosphere and thus with the latitude. At low latitudes the atmospheric window region contained much information about water vapor and mean temperature of the lower atmosphere but very little information about the sea surface teperature. Satellite derived values agreed well with radiosonde data, within 0.53 g per sq cm rms difference. The weekly man distribution of precipitable water over the tropical section of the western Pacific Ocean was obtained for summer and winter. July 1-7, 1979, values varied from 5.0 g per sq cm north of New Guinea at latitudes 10 degrees south to 10 degrees north to 4.0 g per sq cm further from the equator. January 1-7, 1979, values showed a shift of the maximum precipitable water, 3.0 g per sq cm, to the south. Results agreed reasonably with data from other authors and measured climatological data. POTENTIOMETRIC MAP OF THE SPARTA AQUIFER SYSTEM IN MISSISSIPPI, FALL 1980,
Geological Survey, Jackson, MS. Water Resources Div.
B. E. Wasson.
Geological Survey Open-File Report 81-1051 (WRI), 1980. 1 Sheet, 25 Ref.

Descriptors: *Maps, *Potentiometric level, *Aquifers, *Groundwater, Natural recharge, Water level, Observation wells, Water level fluctuations, Geohydrology, Hydrographs, *Mississippi, Sparta aquifer system, Sparta Sand.

This potentiometric map of the Sparta aquifer system is the tenth in a series of maps, prepared by the U.S. Geological Survey in cooperation with the Mississippi Department of Natural Resources, Bureau of Land and Water Resources, delineating the potentiometric surfaces of the major aquifers in Mississippi. In the outcrop area of the Sparta, the potentiometric surface is strongly affected by recharge from precipitation, by topography, and by drainage of the aquifer into streams. The potentiometric surface slopes downward generally to the west away from the area of outcrop and is strongly affected by large ground-water withdrawals in the Jackson, Yazoo City, Cleveland, Clarksdale, and Memphis areas. Historically, water levels in or near the outcrop of the Sparta have shown little or no long-term changes, but during the past 20 years, in much of the confined part of the aquifer, water levels have declined from 1 to 3 feet per year. WATER-LEVEL MAP OF THE MISSISSIPPI DELTA ALLUVIUM IN NORTHWESTERN MISSISSIPPI, APRIL 1981,
Geological Survey, Jackson, MS. Water Resources Div.
D. Darden.
Geological Survey Open-File Report 81-1123 (WRI), 1981. 1 Sheet, 8 Ref.

Descriptors: *Maps, *Water level, *Groundwater, *Alluvial aquifer, Aquifer characteristics, Deltas, Wells, Precipitation, Water level fluctuations, Pumping, Irrigation, Geohydrology, Hydrographs, *Mississippi, Mississippi River valley alluvial aquifer.

Water levels were measured in 454 wells in the alluvial sediments in northwestern Mississippi during the period April 13-24, 1981. Ground-water levels are higher after winter and spring rains and lower after heavy agricultural and industrial pumping. Locally, water levels fluctuate as rivers and streams fluctuate. Because of the drought conditions in April 1981, most water wells had risen several feet. In some areas, however, water levels had not recovered from the relatively low levels measured in September 1980. (USGS)

SELECTED BIOLOGICAL CHARACTERISTICS OF STREAMS IN THE SOUTHEASTERN UINTA BASIN, UTAH AND COLORADO,
Geological Survey, Salt Lake City, UT. Water Resources Div.
R. W. Naten, and R. H. Fuller.
Geological Survey Open-File Report 81-644 (WRI), 1981. 38 p, 26 Fig, 4 Tab, 12 Ref.

Descriptors: *Data collections, *Biological samples, *Water quality, Oil shale, Environmental effects, Bacteria, Benthic fauna, Ecological distribution, *Utah, *Colorado, Uinta Basin.

Biological sampling was carried out during 1976-78 in five streams in the southeastern Uinta Basin, Utah and Colorado, in order to provide baseline water-quality data for an area of potential oil-shale development. The biological activity in the streams sampled generally is limited by physical factors more so than by chemical constituents and plant nutrients. Characteristics of streamflow, such as high turbidity, fluctuating water levels, and moderate to high salinity, limit production of flora and fauna biomass. Samples were collected for the determination of bacterial and periphyton concentrations and benthic-invertebrate communities. Bacterial concentrations were generally small, with some fecal contamination, primarily from livestock and wildlife. Members of the order Chlorophyta (green algae) were the major periphytic algae present in three of the streams sampled. Bitter Creek was dominated by members of the order Cyanophyta (blue-green algae), and pennate diatoms were the predominant algae in Willow Creek. The benthic-invertebrate communities generally reflect a nonpolluted environment. Shannon-Weiner diversity indices ranged from 1.14 to 3.08. (USGS)

WATER RESOURCES DATA FOR OREGON, WATER YEAR 1980--VOLUME 2. WESTERN OREGON.
Geological Survey, Portland, OR. Water Resources Div.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-190364, Price codes: A22 in paper copy, A01 in microfiche.
Geological Survey Water-Data Report OR-80-2, December 1981. 491 p, 5 Fig, 1 Tab.

Descriptors: *Hydrologic data, *Surface water, *Groundwater, *Water quality, Gaging stations, Streamflow, Flow rates, Sediment transport, Water analysis, Water temperature, Chemical analysis, Lakes, Reservoirs, Wells, Water level, Data collections, Sites, *Oregon, Western Oregon.

Water resources data for the 1980 water year for Oregon consist of records of stage, discharge, and water quality of streams; stage, contents, and water quality of lakes and reservoirs; and water levels and water quality in wells and springs. This report, in two volumes, contains discharge records for 287 gaging stations, stage only records for 10 gaging stations, stage and contents for 41 lakes and reservoirs, water quality for 98 gaging stations, water levels for 68 observation wells, and water quality for 6 precipitation stations. Also included are 49 crest-state partial-record stations. Additional water data were collected at various sites, not part of the systematic data-collection program, and are published as miscellaneous measurements. These data represent that part of the National Water Data System operated by the U.S. Geological Survey and cooperating State and Federal agencies in Oregon. (USGS)

SAN JUAN RIVER BASIN,
Geological Survey, Lakewood, CO. Water Resources Div.

Available from the National Technical Information Service, Springfield, VA 22161 as PB82-202045, Price codes: A20 in paper copy, A01 in microfiche. Geological Survey Water-Data Report CO-80-3, 1981. 452 p, 4 Fig, 5 Tab, 42 Ref.

Descriptors: *Hydrologic data, *Surface water, *Groundwater, *Water quality, Gaging stations, Streamflow, Flow rates, Sediment transport, Water analysis, Water temperature, Chemical analysis, Lakes, Reservoirs, Wells, Water level, Data collections, Sites, *Colorado, Dolores River basin, Green River basins, San Juan River basin.

Water-resources data for Colorado for the 1980 water year consist of records of stage, discharge, and water quality of streams; stage, contents, and water quality of lakes and reservoirs, and water levels and water quality of wells and springs. This report (Volumes 1, 2, and 3) contains discharge records for about 460 gaging stations, stage and contents of 22 lakes and reservoirs, 4 partial-record low-flow stations, 30 crest-stage patial-record stations, and 50 miscellaneous sites; water quality for 163 gaging stations and 300 miscellaneous sites; and water levels for 55 observation wells. A few pertinent stations in bordering States also are included. These data represent that part of the National Water Data System collected by the U.S. Geological Survey and cooperating State and Federal agencies in Colorado. (USGS)

A REMOTE SENSING TECHNIQUE FOR ESTIMATING WATERSHED RUNOFF,
Ohio State Univ., Columbus. Dept. of Civil Engineering.
O. Mintzer, and F. Askari.
Available from the National Technical Information Service, Springfield, VA 22161, as PB82-243668, Price codes: A04 in paper copy, A01 in microfiche. Ohio Water Resources Center, Columbus, Report No 712508, October 1980. 53 p, 14 Fig, 13 Tab, 32 Ref, 7 Append. OWRT A-063-OHIO-(1).

Descriptors: *Remote sensing, *Mathematical models, *Regression analysis, *Spectral analysis, *Runoff coefficients, Aerial photography, Satellite technology, Sensors, Telemetry, Infrared imagery, Watershed management, Runoff, Mathematical studies, Data interpretation, Experimental data, Watersheds, Model studies, *Ohio, Mill Creek.

Research was carried out to derive runoff coefficients for watersheds of Mill Creek in Coshocton County, Ohio, from LANDSAT multispectral data by including the more detailed (level II) surface conditions and soil types along with land cover (level I) types in the analysis techniques. Regression models were developed from treating the runoff coefficient of each sample site as the dependent variable, and the mean radiance measurements in the four LANDSAT channels as the independent variables. The models were then extended over the area, and the classification results consisted of digital color-coded maps illustrating spatial variability of runoff potential for the surface. The computer-derived patterns were confirmed with known features within the area, and individual test fields and watersheds were selected for verification of the model results. The model-derived runoff coefficients compared favorably with those obtained from ground truth. It was concluded that, for the sampled sites of the given land cover conditions and soil type, the multispectral data analysis technique described provided reasonable values of runoff coefficients for the watersheds tested. (Zielinski-MAXIMA)

CRITERIA FOR THE USE OF REGRESSION ANALYSIS FOR REMOTE SENSING OF SEDIMENT AND POLLUTANTS,
National Aeronautics and Space Administration, Hampton, VA. Langley Research Center.
C. H. Whitlock, C. Y. Kue, and S. R. LeCroy.
Remote Sensing of Environment, Vol 12, No 2, p 151-168, 1982. 6 Fig. 5 Tab, 19 Ref.

Descriptors: *Remote sensing, *Regression analysis, *Pollutant identification, Radiance, Network design, Satellite technology, Errors, *Sediments. The limitations, requirements, and precision of linear multiple regression techniques for quantifying marine environmental parameters such as sediments and pollutants were evaluated. Radiance was the independent variable. Both environmental and optical physics conditions were defined for which an exact solution to the signal response equation is of the same form as the multiple regression equation. One problem with using this regression technique is that the independent variables. (Upwelled radiaces) contained errors which were often correlated with each other. This situation required a large number of statistical parameters when performing the regression analysis. Examination of field experiments showed that the magnitude of the data noise required data smoothing before Daniel and Wood's criteria could be satisfied for the least-square multiple regression process. To minimize data smoothing requirements and associated physical errors, ground truth locations whould be carefully chosen. Specific suggestions for environmental and ground truth conditions are given. (Cassar-FRC)

ON THE RELATIONSHIP BETWEEN KRIGING AND STATE ESTIMATION,
Princeton Univ., NJ. Dept. of Civil Engineering.
G. R. Chirlin, and E. F. Wood.
Water Resources Research, Vol 18, No 2, p 432-438, April, 1982. 1 Fig, 17 Ref.

Descriptors: *Spatial distribution, *Estimating equations, *Statistical analysis, Model studies, *Probability distributions, Stationary process, Hydrologic data, Mathematical studies, *Kriging, *State estimation.

Universal kriging is one method of interpolating sampled random spatial processes which has applications in hydrology. The interpolation task is complicated by process noise and data measurement error. Kriging is a technique which refers to a family of stochastic process models plus associated parameter estimation procedures. It is based on a theory of 'differencing' of n-dimensional spatial processes and is well developed for the delineation of mineral deposits. Universal kriging interpolates a discrete stationary spatial process obtained by polynomial filtering through spatial differencing of the original nonstationary process. In this paper, the universal kriging axioms, calculation of some statistics of the kriging system variables, definition and solution of the state space version of the kriging problem, and an example are presented. (Titus-FRC)

OPTIMIZING THE EVALUATION OF LAKE WATER QUALITY THROUGH ANALYSIS OF EXISTING REMOTELY SENSED DATA,
Cornell Univ., Ithaca, NY. School of Civil and Environmental Engineering.
W. R. Philipson, K. Kozai, and E. L. Mills.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-256637, Price codes: A03 in paper copy, A01 in microfiche. Report, December, 1981. 29 p, 8 Fig, 4 Tab, 49 Ref, 1 Append. OWRT A-091-NY(1). 14-34-0001-1134.

Descriptors: *Water quality, *Eutrophic lakes, *Remote sensing, *Satellite technology, *Regression analysis, Evaluation, Sensors, Telemetry, Mathematical models, Computer models, Mathematical studies, Model studies, Water quality control, Lakes, Chlorophyll A, Density stratification, Air temperature, Wind, Lake breezes.

A methodology development was undertaken for use in selecting optimum sampling locations for water quality assessment in a large eutrophic New York State lake (Oneida Lake). The methodology approach was based on the premises that Landsat satellite image densities can be modeled, and that homogeneous water quality areas could be thereby predicted. Patterns of Lake density on 24 Landsat band-5 images (0.6-0.7 microns) were traced from a density-slicer screen, following standardization of the color assignments with dark- and a light-toned feature. The Lake was griddled into 161 cells (1.25 km by 1.25 km each), and density levels from each image were encoded for each cell. Cell density levels were used as the dependent variable in correlations and multiple regressions with degree days, and resultant wind speed and direction. Further, equation-predicted density levels in selected cells were correlated with measured values of chlorophyll-A, chlorophyll-a plus pheophytin, and Secchi disk transparency. It was found that the use of degree days and wind in evaluating water quality represents a promising and improved approach. While reliability of the regression equations was too low to develop an effective lake sampling strategy, results suggest further study appears justified. (Zielinski-MAXIMA)

THE PRACTICAL HANDLING OF WATER QUALITY MONITORING DATA,
Department of the Environment, Reading (England). Water Data Unit,
R. V. Moore, and D. W. C. Rodda.
Water Science and Technology, Vol 13, No 11/12, p 707-714, 1981. 2 Fig, 7 Ref.

Descriptors: *Water quality, *Monitoring, *Data storage and retrieval, Computers, Data management, Data collections, *United Kingdom, Water quality data, Hydrologic data collections.

Ten regional authorities in England and Wales have responsibility for all aspects of the water cycle, including monitoring of water quality. These authorities collect data for their own water management needs, for assessing the effectiveness of water pollution legislation, and for determining the rate of improvement or deterioration of water resources. The need for similar types of information and for information which can be compared among the regions has led to the development of the Water Archive System, which provides a cost-effective solution to the organization and control of data for the authorities. The Water Archive System manages water quality data; hydrological, biological, and meteorological data; and data on water supply and wastewater disposal. The objectives and applications of this national computer-based system are described. The computer system is simple in concept and use, but capable of handling a wide range of data. A high level of user participation in project management has been encouraged in order to promote commitment to the project. A System for achieving national agreement with respect to data definitions has helped to promote data comparability. The Water Archive System is currently used by seven of the regional water authorities, as well as by the British Department of the Environment and by the Ministry of Agriculture, Fisheries, and Food. WATER RESOURCES DATA FOR TENNESSEE, WATER YEAR 1980.
Geological Survey, Nashville, TN. Water Resources Div.
Geological Survey Water-Date Report TN-80-1, 1981. 513 p, 6 Fig.

Descriptors: *Hydrologic data, *Surface water, *Groundwater, *Water quality, Gaging stations, Streamflow, Flow rates, Sediment transport, Water analysis, Water temperature, Chemical analysis, Lakes, Reservoirs, Wells, Water levels, Data collections, Sites, *Tennessee.

Water resources data for the 1980 water year for Tennessee consist of records of stage, discharge, and water quality of streams and springs; stage, contents, and water quality of lakes and reservoirs; and water levels and water quality of wells. This report contains discharge records for 108 gaging stations, stage only records for one lake gaging station, elevation and contents for 27 lakes and reservoirs, water quality for 82 stations and 21 wells, and water levels for 26 observation wells. Also included are 127 crest-stage partial-record stations, 73 low-flow partial-record stations, and 80 coal-hydrology partial-record stations. Additional water data were collected at various stream and spring sites not involved in the systematic data-collection program and are published as miscellaneous measurements and analyses, or as seepage investigations of discharge and water quality. These data represent that part of the National Water Data System operated by the U.S. Geological Survey and cooperating State and Federal agencies in Tennessee. (USGS)

HYDROLOGIC DATA FOR URBAN STUDIES IN THE SAN ANTONIO, TEXAS METROPOLITAN AREA, 1978,
Geological Survey, Austin, TX. Water Resources Div.
R. Perez.
Available from the OFSS, USGS, Box 25425, Fed. Ctr., Denver, CO 80225, Paper copy $11.75, Microfiche $3.50. Geological Survey Open-File Report 81-922, August, 1981. 91 p, 1 Fig, 5 Tab, 5 Ref.

Descriptors: *Urban hydrology, *Rainfall-runoff relationships, *Storm runoff, *Urban runoff, *Hydrologic data, Small watersheds, Streamflow, Flow rates, Flood peak, Flood profiles, Watershed Management, *Texas, San Antonio.

This report contains rainfall, runoff, and water-quality data collected during the 1978 water year for the San Antonio metropolitan area. The information will be useful in determining the effects of various stages of ubanization on flood discharge and runoff and in determining chemical constituents in surface-water runoff from floods of various magnitudes during all seasons of the year from areas with different types of urban development. Detailed rainfall-runoff computations are presented for several storm periods during the 1978 water years. (USGS)

WATER-RESOURCES INVESTIGATIONS OF THE U. S. GEOLOGICAL SURVEY IN ARKANSAS--FISCAL YEAR 1981.
Geological Survey, Little Rock, AR. Water Resources Div.
Available from the OFSS, USGS, Box 25425, Fed. Ctr., Denver, CO 80225, Paper copy $6.50, Microfiche $3.50. Geological Survey Open-File Report 81-1003, 1981. 44 p, 20 Fig. (Gurley, M. O., Compiler).

Descriptors: *Data collections, *Groundwater, *Water quality, *Surface water, Gaging stations, Sites, Streamflow, Flow characteristics, Sediments, Dye releases, Sampling, Water level, Wells, Water use, *Arkansas.

During fiscal year 1981 there were 20 water-resources investigations in progress by the Arkansas District of the U. S. Geological Survey's Water Resources Division. Investigations that mainly involved data collection included surface-water gaging, water-level measuring, water-quality sampling, sediment sampling, and water-use inventorying. Interpretive studies included three that were principally of ground-water resources, four that were of surface-water flow charateristics, four that were of surface-water quality characteristics, and three that were interdisciplinary. WATER RESOURCES DATA, LOUISIANA, WATER YEAR 1981--VOLUME 1. CENTRAL AND NORTHERN LOUISIANA.
Geological Survey, Baton Rouge, LA. Water Resources Div.
Geological Survey Water-Date Report LA-81-1, 1981. 424 p, 10 Fig.

Descriptors: *Hydrologic data, *Surface water, *Groundwater, *Water quality, Gaging stations, Streamflow, Flow rates, Sediment transport, Water analysis, Water temperature, Chemical analysis, Lakes, Reservoirs, Wells, Water level, Data collections, Sites, *Louisiana, Central and Northern Louisiana.

Water resources data for the 1981 water year for Lousiana consist of records of stage, discharge, and water quality of streams; stage, contents, and water quality of lakes and reservoirs; and water levels and water quality of ground water. This report, in three volumes, contains records for water discharge at 81 gaging stations (including stage of 76 of these stations); stage only for 37 gaging stations and 10 lakes; contents for 1 reservoir; water quality for 142 surface-water stations (including 35 gaging stations), 27 miscellaneous sites, 10 lakes, and 286 wells; and water levels for 679 observation wells. Also included are data for 250 crest-stage and flood-profile stations. Additional water data were collected at various sites not involved in the systematic data-collection program, and are published as miscellaneous measurements. Records for a few pertinent stations in bordering States are also included in this report. These data represent that part of the National Water Data system operated by the U.S. Geological Survey and cooperating State and Federal agencies in Louisiana. (USGS)

POTENTIOMETRIC MAP OF THE COCKFIELD AQUIFER IN MISSISSIPPI, FALL 1980,
Geological Survey, Jackson, MS. Water Resources Div.
B. E. Wasson.
Geological Survey Open-File Report 81-1053 (WRI), 1981. 1 Sheet, 22 Ref.

Descriptors: *Maps, *Potentiometric level, *Aquifers, *Goundwater, Natural recharge, Water level, Observation wells, Water level fluctutations, Geohydrology, Hydrographs, *Mississippi, Cockfield formation, Cockfield aquifer.

This potentiometric map of the Cockfield aquifer is the eleventh in a series of maps, prepared by the U.S. Geological Survey in cooperation with the Mississippi Department of Natural Resources, Bureau of Land and Water Resources, delineating the potentiometric surfaces of the major aquifers in Mississippi. In the outcrop area of the Cockfield quifer the potentiometric surface is strongly affected by recharge from precipitation, by topography, and by drainage of the aquifer by streams. The potentiometric surface slopes downward generally to the west away from the area of outcrop and is strongly affected by large ground-water withdrawals in the Jackson and Greenville areas. Historically, water levels in or near the outcrop of the Cockfield aquifer have shown little or no long-term changes, but in much of the confined part of the aquifer during the past 20 years, water levels have declined from 1 to 2 feet per year. ORGANIC SOLUTES IN GROUND WATER AT THE IDAHO NATIONAL ENGINEERING LABORATORY,
Geological Survey, Lakewood, CO. Water Resources Div., and Geological Survey, Idaho Falls, ID. Water Resources Div.
J. A. Leenheer, and J. C. Bagby.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-195280, Price codes: A03 in paper copy, A01 in microfiche.
Geological Survey Water-Resources Investigations 82-15, March 1982. 39 p, 4 Fig, 3 Tab, 15 Ref.

Descriptors: *Organic compounds, *Groundwater, *Water quality, *Path of pollutants, Observation wells, Monitoring, Sampling, Pesticides, Radioactive waste disposal, Aquifers, Groundwater movement, Geochemistry, *Idaho, Snake River Plain aquifer, Idaho National Engineering Laboratory.

In August 1980, the U.S. Geological Survey started a reconnaissance survey of organic solutes in drinking water sources, ground-water monitoring wells, perched water table monitoring wells, and in select waste streams at the Idaho National Engineering Laboratory. The survey was to be a two-phase program. In the first phase, 77 wells and 4 potential point sources were sampled for dissolved organic carbon (DOC). Four wells and several potential point sources of insecticides and herbicides were sampled for insecticides and herbicides. Fourteen wells and four potential organic sources were sampled for volatile and semivolatile organic compounds. The results of the DOC analyses indicate no high level organic contamination of ground water. The only detectable insecticide or herbicide was a DDT concentration of 10 parts per trillion (0.01 microgram per liter) in one observation well. The volatile and semivolatile analyses do not indicate the presence of hazardous organic contaminants in significant amounts (>10 micrograms per liter) in the samples taken. Due to the lack of any significant organic ground-water contamination in this reconnaissance survey, the second phase of the study, which was to follow up the first phase by additional sampling of any contaminated wells, was cancelled. HYDROGEOTHERMAL MAPPING OF THE ACTIVE WATER-EXCHANGE ZONE IN THE USSR,
All Union Scientific Research Inst. of Hydrogeology and Engineering Geology, Moscow (USSR).
N. M. Frolov.
Water Resources, Vol 8, No 3, p 319-328, May/June, 1981. 2 Fig, 3 Tab, 11 Ref. Translated from Vodnye Resursy, No 3, p 154-166, May/June, 1981.

Descriptors: *Maps, *Geohydrology, *Heat flow, Groundwater, *USSR, Temperature gradient, Geologic mapping, *Geothermal studies, Heat transfer.

The existing USSR hydrogeothermal maps of the active water exchange zone are described and analyzed. The first hydrogeothermal map of the USSR was prepared in 1962. Geothermal maps, compiled without consideration of hydrogeological features, had been prepared before this date. The 'Hydrogeothermal Atlas of the USSR,' published in 1975-77, included maps of geoisotherms of the neutral layer (average long-term groundwater temperature), geoisotherms of depths of 125 and 250 m, and other related maps. Thermometric investigations showed that the mean differences between regional geotemperature field and actual temperature measurements were 0.2 C at 25 m depth and -3.0 C at 125 m depth. Conclusions reached on the basis of these maps were that low heat fluxes are present for depths of 250 m in the northern regions of the country and that the geotemperature and thermal fields to at least 250 m were formed under exogenic rather than endogenic influences. The neutral Layer iiin the USSR is mainly within 15-25 m in regions of clays, peats, and loams. In central regions of the European USSR the thickness of the layer of annual variable temperature exceeds 35 m because of the predominance of sands and loam sands and the confinement of the regions to the zone of surplus water. (Cassar-FRC)

NUMERICAL MODELING OF UNSTEADY FLOWS IN OPEN CHANNELS,
Novosibirsk State Univ. (USSR).
M. T. Gladyshev.

Recent work (1974-80) on numerical methods for calculating flows in hydraulic engineering, as developed at Novosibirsk University, is reviewed. The methods are based on numerical solutions of St. Venant equations for one-dimensional unsteady flows. A General Statement of the problem of two-dimensional unsteady flows was formulated, allowing isolation of the breakthrough wave and moving boundary along a dry bottom. Three types of problems were solved by finite difference methods: smooth flows in a channel with vertical walls, discontinuous flows in a channel with vertical walls, and propagation of a breakthrough wave along a dry and wet bottom with isolation of the leading edge. Two-dimensional flows were calculated for the problem of dam failure in the case of a dry and wet bottom. Many experiments were carried out for the case of moving boundaries of liquid layers. For example, the method of moving meshes was used in problems of the inflow of a heavy liquid into a channel with a light and also on failure of a dam with a two-layer reservoir. (Cassar-FRC)

WATER RESOURCES DATA FOR ALABAMA, WATER YEAR 1980--VOLUME 1. APALACHICOLA, CHOCTAWATCHEE, BLACKWATER, ESCAMBIA, PERDIDO, AND ALABAMA RIVER BASINS,
Geological Survey, Univ., AL. Water Resources Div.
Water-Data Report AL-80-1, 1981. 225 p, 7 Fig.

Descriptors: *Hydrologic data, *Surface water, *Groundwater, *Water quality, Gaging stations, Streamflow, Flow rates, Sediment transport, Water analysis, Water temperature, Chemical analysis, Lakes, Reservoirs, Wells, Water level, Data collections, Sites, *Alabama, Apalachicola River basin, Choctawatchee River basin, Blackwater River basin, Escambia River basin, Perdido River basin, Alabama River basin.

Water resources data for the 1980 water year for Alabama consist of records of stage, discharge, and water quality of streams; stage and contents of lakes and reservoirs, and water levels in wells. This report contains discharge records for 49 gaging stations, stage only for 15 gaging stations, stage and contents for 8 lakes and reservoirs, water quality for 34 gaging stations, and water levels for 11 observation wells. Also included are 21 low-flow partial-record stations, 16 crest-stage partial-record stations, 7 flood hydrograph partial-record stations, and 8 water-quality partial-record stations. Additional water data were collected at various sites, not part of the systematic data-collection program, and are published as miscellaneous measurements and analyses. These data represent that part of the National Water Data System operated by the U.S. Geological Survey and cooperating State and Federal agencies in Alabama. (USGS)

fiche. Water-Data Report OR-80-1, 1981. 244 p, 5 Fig, 1 Tab.

Descriptors: *Hydrologic data, *Surface water, *Groundwater, *Water quality, Gaging stations, Streamflow, Flow rates, Sediment transport, Water analysis, Water temperature, Chemical analysis, Lakes, Reservoirs, Wells, Water level, Data collections, Sites, *Oregon, Eastern Oregon.

Water resources data for the 1980 water year for Oregon consist of records of stage, discharge, and water quality of streams; stage, contents, and water quality of lakes and resrvoirs; and water levels and water quality in wells and springs. This report, in two volumes, contains discharge records for 287 gaging stations, stage only records for 10 gaging stations, stage and contents for 41 lakes and reservoirs, water quality for 98 gaging stations, water levels for 68 observation wells, and water quality for 6 precipitation stations. Also included are 49 crest-stage partial-record stations. Additional water data were collected at various sites, not part of the systematic data-collection program, and are published as miscellaneous measurements. These data represent that part of the National Water Data System operated by the U.S. Geological Survey and cooperating State and Federal agencies in Oregon. (USGS)

DEVON FLOODS AND THE WATERWAYS OF BRIDGES,
A. B. George.
Proceedings of the Institution of Civil Engineers. Part 2: Research and Theory, Vol 73, No 1, p 125-134, March, 1982. 4 Fig, 6 Tab, 10 Ref.

Descriptors: *Bridges, *Channel scour, *Flood damage, Flood channels, Flood control, Flood flow, Flood frequency, Devon, Rivers, Design criteria, Highways, Annual floods, Historic floods, Channel improvement.

Floods in Devon in 1952, 1960, 1968, and 1979 caused widespread bridge destruction. Damage in the region was caused by the intensive energy of the flowing water in the steep terrain and by inundation. Return peiods of the floods varied from 6 to 600 years and reatios of major flood to mean annual flood were up to 3.31. It is suggested that mean annual flood be calculated using an equation with more independent variables (area, soil type, and one day net rainfall for a 5 -year return period) than the commonly used formula, which uses area as its only dependent variable. Bridges should be designed to withstand a 1000-year flood at a location immediately downstream of a community, a 150-year flood for bridges carrying motorways and trunk roads, a 30-150-year flood for bridges carrying less important roads, and a 5-year flood for submersible bridges in very rural areas. All bridges should pass the mean annual flood at or below bank-full level. (Cassar-FRC)

PLANNING SRI LANKA'S VICTORIA SCHEME,
Preece, Cardew and Rider, Brighton (England).
J. C. Bennett, and T. G. Carpenter.
International Water Power and Dam Construction, Vol 34, No 5, p 67-73, May, 1982. 8 Fig, 2 Tab.

Descriptors: *Hydroelectric plants, *Dam design, Irrigation, Victoria Dam, *Sri Lanka, Mahaweli Ganga, Reservoirs, Planning, Arch dams.

The planning process for Sri Lanka's Victoria multipurpose dam scheme on the Mahaweli Ganga is described. The proposed project, scheduled for completion in 1984-85, will provide power and irrigation water for the region until 1990. At that time the installed capacity will be doubled to about 420 MW to handle peak demands. A double-curvative arch dam of 118 m maximum height and normal top water level of 438 m was found suitable for the site at Victoria Falls near Kandy. (Cassar-FRC)

COLD REGIONS ENGINEERING IN NORWAY,
Norwegian Road Research Lab., Oslo.
K. Flaate.
Civil Engineering (New York), Vol 52, No 4, p 68-69, April, 1982. 5 Fig.

Descriptors: *Ice, *Road construction, Frost heaving, Cold regions, Roadbanks, Highways, Paving, Design criteria, Construction, Tunnels, Freezing, Ice formation, *Norway.

In much of Norway and other cold regions, damage from frost-heaving, icing of roads, freezing of water pipes, and reduced bearing capacity of subsoil are common. In the last two decades Norwegian engineers have concentrated their efforts on research and practical solutions to these problems, with excellent results. Cracking of asphalt paving can be reduced by reinforcement with steel mesh or a mesh of other suitable materials. Monitoring is performed throughout the year to evaluate the bearing capacity of the roads. If the freezing index exceeds a given level, it is necessary to insulate the drainage system around a tunnel. Since there is not much loss of heat due to radiation inside a tunnel, the icing problem is not as severe as in the open, and a rather thin pavement above the insulation will be sufficient. DESIGN TECHNIQUE DEVELOPMENT FOR DAMS IN SOUTH AFRICA,
Department of Environmental Affairs (South Africa).
W. C. S. Legge.
Aqua, No 2, p 378-380, 1982.

Descriptors: *Design criteria, *Dam design, *Dam construction, Concrete dams, Earth dams, Rockfill dams, *Reservoir construction, *South Africa, Dams, Dam foundations, Dam stability, Rock mechanics, Soil mechanics, Tensile stress, Reservoirs, Construction, Technology, Engineering.

Over the past 80 years, the construction of dams and reservoirs in South Africa has been influenced by developments in engineering technology. In the 1930's, the science of soil mechanics was applied to dam construction, while the instrumentation of early concrete arch dams was confined to deflection surveys. After World War II, the design of arch dams was improved from the trial load method through wire models and deflection models to the analytical methods of finite element type presently in use. Improvements in techniques for placing mass concrete aided in the construction of several large dams, while a better understanding of the elasticity of earthen embankments was developed. The ability to move large volumes of earth and rockfill has allowed the construction of earth and rockfill embankments where the construction of concrete dams is not feasible. The latest design technologies allow engineers to test dam safety features as well as the tensile forces on the upstream face of arch dams. (Geiger-FRC)

SOME GEOTECHNICAL ASPECTS OF THE CONSTRUCTION OF THE 'SAFETY RESERVOIR BROECHEM',
Antwerp Water Works (Belgium). Dept. of Civil Engineering.
H. Crommelinck, and J. Dirickx.
Aqua, No 2, p 385-396, 1982. 19 Fig.

Descriptors: *Reservoir storage, *Reservoir construction, *Earth dams, *Storage reservoirs, *Design criteria, Construction, Reservoirs, Reservoir linings, Hydraulic-fill dams, Reservoir siting, Site selection, Storage, Drinking water, Water supply, Water supply development, Earthworks.

The Antwerp Water Works of Belgium has decided to erect a security reservoir to ensure that the surface waters of the river Meuse will be able to supply drinking water to about 1 million people. A construction site along the adduction area of the Albertcanal and in the vicinity of the Oelegem treatment plant was chosen for the Brochem Reservoir, which will support a useful capacity of 4.5 million cu m raw water. Water will be transported by gravity to the nearby treatment works. After pilot studies on compaction techniques, the earth dam was compacted by vibroflotation and squeezing of mud with compacted gravel. Sounding tests showed adequate compaction by these methods of the clayey deposit and sandy hydraulic fill to be used as the foundation of the 10 m high reservoir. After extensive calculations of membrane requirements, a membrane composed of mainly nylon-reinforced bitumen with a polyethylene sheet was chosen to line the slopes of the reservoir. The bottom of the reservoir was waterproofed by clayey particles from the raw water of the Albertcanal. A permanent drain was constructed to handle accidental seepage through the bottom of the reservoir due to cracks of fissures in the waterproof membrane. The reservoir may be used in 1982 after the electro-mechanical installation is completed. (Geiger-FRC)

THE BIESBOSCH WATER STORAGE SCHEME,
Biesbosch Water Storage Corp. (Netherlands).
P. L. Knoppert, and E. G. H. Vreedenburgh.
Aqua, No 2, p 381-384, 1982. 3 Fig.

Descriptors: *Reservoir construction, *Reservoir design, *Reservoir storage, Safe yield, Multipurpose reservoirs, Water supply development, Reservoirs, Water quality control, Reservoir linings, Reservoir sites, Storage reservoirs, Multireservoir networks, Dikes, Earthworks, Construction.

The western and northern parts of the Netherlands rely mainly on fresh surface water from the Rhine and Meuse Rivers for their drinking water supplies. Problems with salt water intake into water treatment plants in 1963 caused the local governments to look to the river Maas to supply a higher quality drinking water source for the Rotterdam area. The construction of reservoirs in the Biesbosch, a deltaic area south of Rotterdam, was necessary to store water from the Maas to bridge periods of low flow and improve water quality. Calculations to determine the safe yield, required volume for bridging functions, and required volume for improved water quality were made for the three reservoirs of the Biesbosch water storage scheme. A second planning phase will provide for an extension with a fourth reservoir. Reservoirs were constructed partly by raising the water level above the surrounding area by dikes and partly by excavating the ground between the dikes. Dikes were lined with a membrane of nylon fabric placed on sand-tight fabric overlined with stone. The completed reservoir area was landscaped to maximize the recreational functions of the area while minimizing interference with the natural deltaic creek system and existing agricultural polders as much as possible. The safe yield storage of the first three reservoirs amounts to 250 million cu m/yr, a figure which will increase to 500 million cu m/yr when the fourth reservoir is built to meet increased water quality and quantity demands. (Geiger-FRC)

BLOOMINGTON LAKE - POTOMAC RIVER WATER RESOURCES PROJECT,
Army Engineer District, Baltimore, MD.
J. W. Peck.
Civil Engineering (New York), Vol 52, No 6, p 47-49, June, 1982.

Descriptors: *Dams, *Construction, *Design criteria, Construction materials, Water quality, Flood control, Bloomington Lake, *Bloomington Dam, *Potomac River, Maryland, *Earth dams, Cofferdams, Rockfill dams, Rolled-earth dams, Dikes, Earthworks.

The Bloomington Dam is located about a 4 hr drive west of Baltimore on the Potomac River.

The complex planning of the project took almost 19 years, and it consists of a main embankment, dike, spillway, intake tower, tunnel, and other structures. In order to construct the dam, relocation of a railroad, highways, and utilities was required. Twenty construction contracts were awarded, for a total construction cost of $174,300,000. The dam embankment is a rolled earth and rockfill structure founded on bedrock throughout. It has a maximum height of 296 feet above streambed, a crest length of 2,130 feet, and is comprised of a total volume of 10.5 million cubic yards of earth and rock fill. In a saddle a short distance from the left abutment of the dam is a dike embankment which is a rolled earth and rockfill structure having a height of 89 feet, a crest length of 880 feet and a total volume of over 1 million cubic yards. One of the major concerns with embankment construction is the contact surface between the embankment and foundation surface. Extensive use was made of mini-cam photogrpahy equipment to constantly record various features of the work as it progresssed. A small dike was constructed to divert the river into the completed outlet tunnel so the cofferdam and foundation preparation work could be done. Flood control will provide major benefits to the downstream communities some 25 miles below the dam. Water quality accounts for 51% of the benefits of this project. Value engineering was used effectively throughout the construction of the project, with over $3 million in savings realized. (Baker-RC)

OLMOS DAM MODIFICATION.
Civil Engineering (New York), Vol 52, No 6, p 54-55, June, 1982. 2 Fig.

Descriptors: *Dams *Flood control, Construction, Olmos Dam, Design criteria, Spillways, *Texas, San Antonio River

Olmos Dam is located on Olmos Creek, which is a tributary of the San Antonio River northeast of the central business district of San Antonio, Texas. In 1973 a study disclosed that flood routings produced by severe storms over the drainage basin would overtop the dam by varying amounts, and the structure would be overstressed beyond the permissible limits of current design. The reduced factors of safety could have resulted in failure. Olmos dam is a dry reservoir dam, holding water only as a result of heavy rains flooding the area. The safety study suggested several modifications, including provisions of an ogee spillway section with flip bucket at the central portion of the dam structure with crest at elevation 728, 1287 feet long, capable of passing the probable maximum flood. The Olmos Drive roadway across the top of the dam was to be removed. A new gate operating room was to be built atop the non-overflow section. Increased stability of the spillway portion was achieved by addition of mass concrete. Dam stability was increased in the non-overflow portions by vertical prestressing of the dam structure. Modifications to retain the 200 year flooding flow with zero outflow for some hours for staged release in consideration of potential impact on the downtown area of a flood were made. The relocation and reconstruction within the dam structure of major telephone trunk line were performed and an inspection gallery was provided. One problem during construction was excessive groundwater in the limestone stratum at the contact plane for the dam. (Baker-FRC)

SAFETY ASPECTS IN THE DESIGN AND INSPECTION OF DAMS,
COBA-CONSULPRESA, Lisbon (Portugal).
J. L. Serafim.
International Water Power and Dam Construction, Vol 34, No 5, p 45-47, May, 1982. 8 Ref.

Descriptors: *Dam failure, *Design criteria, *Safety, Gravity dams, Buttress dams, Arch dams, Earth dams, Rockfill dams, Spillways, Outlets, Errors, Inslpection, Dam construction, Dam design, Dam foundations, Dam stability.

A listing of scenarios for rupture and hazard scenarios (serious incidents) can help in design of new dams, in judging the safety and reliability of old dams, and in avoiding most human errors. Dam failures depend on height (low dams fail more often than high dams), type of dam (arch dams are are most stable), materials (earth dams are most vulnerable), location, age (very new and very old dams are most likely to fail), and quality of design. Overtopping accounts for a third of disasters. Other causes are piping, abnormal uplift, foundation defects and wearness, earthquakes, weak materials, erroneous design, and poor construction. A listing of hazard scenarios is given for all types of dams. This includes sudden filling of a lake and overtopping of a dam, closure of a valley by mountain movement, piping, ground differential motion at the foundation, inadequate design, faulty construction, and subsidence of the foundation from earthquakes or subterranean water drainage. Additional hazard scenarios are given for specific types of dams: gravity, buttress, arch, multiple arch, earth, rockfill, spillways, and outlets. (Cassar-FRC)

THE ITAIPU HOLLOW GRAVITY DAM,
Promon Engenharia, Sao Paulo (Brazil).
D. M. Caric, L. P. Eigenheer, J. Uriarte, A. Szpilman, and A. Gallico.
International Water Power and Dam Construction, Vol 34, No 5, p 30-44, May, 1982. 19 Fig, 5 Tab, 14 Ref.

Descriptors: *Hydroelectric plants, *Dam design, Itaipu Dam, Brazil, Paraguay, *Parana River, Hollow dams, *Gravity dams, Dam construction, Concrete dams, Hydraulic structures, Dam foundations, Grouting, Drainage, Stress analysis, Dam stability, *Hollow construction dams.

The civil works at the Itaipu hollow gravity dam on the Parana River, Brazil-Paraguay, are scheduled for completion by the end of 1982. The structure is 612 m long and consists of 18 blocks each 34 m wide. The blocks range from 100 to 196 m high, making Itaipu the highest hollow gravity dam in the world. The 1260 MW final capacity and annual generation of 75,000 GWh will make this the largest power station in the world when it is completed in 1988. The hollow construction requires 25% less concrete than solid construction, has better stability against overtopping, better head dissipation, greater construction flexibility, less hydraulic uplift, more effective drainage, and 12% lower costs. However, the concrete for a hollow dam requires a higher proportion of cement, more framework, more complex concrete shapes, a complex benched excavation on sloping abutments, some steel reinforcement, and higher engineering costs. Nevertheless, the the Itaipu dam the hollow construction gave a savings of 1.3 million cu m of concrete and 6 months of construction time. Detailed descriptions and drawings are given for the hollow block shape, longitudinal and transverse contraction joints, and concrete temperature control. The foundation's geology, configuration, treatment, grouting, and drainage are described. Stress and stability tests are also discussed. (Cassar-FRC)

INVESTIGATION OF THE OVERFLOW SPILLWAY OF THE VELISHCHAI RESERVOIR.
Z. A. Musaev
Hydrotechnical Construction, Vol 15, No 7, p 414-417, 1981. 2 Fig, 2 Tab, 2 Ref. Translated From Gidroteknicheskoe Stroitel'stvo, No 7, p 25-27, July, 1981.

Descriptors: *Spillways, *Reservoirs, *Intake gates, *Design criteria, *Dam construction, *Model studies, *Wave action, Dams, Reservoir storage, Mathematical studies, Mathematical models, Aeration

The proposed design of the overflow spillway of the Velischai reservoir which was constructed to irrigate the lands of the Masally region of the Azerbaidzhan SSR was investigated. The height of the side walls was determined without considering the occurrence of aeration of the flow and rolling waves. Experimental data on aeration and wave formation on the conveyance flume was obtained for a parapet design with one-way overflow of water. Studies on two-way overflow revealed an improved hydraulic regime of flow both in the intake and in the horizontal section of the spillway model. By arranging the intake flume angles at 80 degrees to the axis of the dam, a two way intake in the given layout of the hydrodevelopment was achieved. With a specific parapet design, the useful storage of the reservoir was increased by raising the elevation of the spillway sill of the intake part without increasing the amount of works on the dam. This produces additional net income during the payback period, resulting in greater annual savings. (Geiger-FRC)

REGIONAL DETENTION BASINS FOR STORMWATER CONTROL,
Whiteley-Jacobsen and Associates, Portland, OR.
G. E. DiLoreto.
Public Works, Vol 113, No 5, p 61-62, May, 1982. 1 Fig.

Descriptors: *Storm water, *Detention reservoirs, *Drainage systems, Storm runoff, St. Helens, *Oregon, Design criteria, Runoff, Urban Runoff, Controlled drainage.

Regional detention basins were chosen as the best storm water control option at St. Helens, Oregon, since the topsoil overlying impermeable basalt is only 1-2 feet deep, precluding economical construction of drainage pipes and open channels. Maintenance costs associated with a few large regional basins are much less than costs of hundreds of small detention ponds. Design considerations for regional detention basins are: sediment traps, consideration of soil characteristics and groundwater table, a bank slope of 3:1 horizontal and vertical, low flow bypass channels, emergency spillways for events exceeding the design storm, maximum depth of 4 ft with 1 ft of freeboard, a 1% bottom slope toward the low flow bypass channel, and stabilized banks. (Cassar-FRC)

SAFETY OF DAMS (SICHERHEIT VON TALSPERREN),
Technische Univ., Munich (Germany, F. R.). Lehrstuhl fuer Wasserbau.
H. Blind.
Wasserwirtschaft, Vol 72, No 3, p 84-90, 1982. 8 Fig, 4 Tab. English Summary.

Descriptors: *Safety, *Dams, *Dam failure,*Design criteria, Dam design, Control systems, Statistics, Data collections, Accidents, Erosion, Subsoil, Flooding, Dam stability, Geology, Hydrology, Hydraulic engineering.

Dam failures and their causes are discussed, and measures to improve the safety of dams are suggested. Registration of all new dams and the reporting of damage thereto is urged so that the analysis of these data may lead to improved design and construction. It is not possible to extrapolate a probability figure for dam failure. Problems with data so far collected (e.g., the International Conference on Large Dams World Register of Dams) include insufficient information, the necessity of using simplified definitions because each case is individual, lack of investigation of the cause of accidents, and differences in environment, design, and construction. Statistics show that causes of failure for earth dams include flooding at high water due to failure of spillways or gates, internal erosion near the foundation, settling of the dam or foundation, contact erosion, inhomogeneity of subsoil, liquefaction, and piping effect; for masonry and concrete dams, causes include insufficient shear strength in the foundation bottom, too great an upward hydraulic pressure on the foundation, lack of stability of the dam, abnormal plasticity of the subsoil and high permeability, and seepage and erosion in the foundation bottom due to permeability. To improve dam safety, certain principles of design and construction should be followed. These include the use of well-qualified engineers and

LIBRARY U. OF I., URBANA-CHAMPAIGN

reliable business firms, thorough site studies, especially in hydrology and geology, careful consideration of design flood and the hydraulic requirements of tail flow, study of the plasticity of the dam and subsoil, a constructive conception of bottom sealing for permeable rock, installation of an observation and control system, the capability of performing future renovations, and the ability to build the dam in a given time. INFLUENCE OF REMEDIAL MEASURES ON THE MOHNE GRAVITY DAM (EINFLUSS DER SANIERUNGSMASSNAHMEN AUF DIE MOHNEMAUER),
Ruhetalsperrenverein, Essen (Germany, F. R.).
K. -H. Idel, and P. Rissler.
Wasserwirtschaft, Vol 72, No 3, p 130-134, 1982. 4 Fig, 3 Tab, 1 Ref. English Summary.

Descriptors: *Gravity dams, *Renovations, *Grouting, *Drainage engineering, Reservoirs, Mohne reservoir, *West Germany, Maintenance, Seepage, Water pressure, Thermal stress, Strength, Hydraulic engineering, Permeability, Construction, Dam construction, Damage, Aging.

Renovations were carried out on the masonry gravity dam of the Mohne Reservoir, West Germany, between 1972 and 1978 to counteract the destructive effects of aging and of air raids during World War II. In 1943 the middle section of the dam was destroyed in an air attack, and hasty repairs resulted in uncontrollable seepage in this section. Damage appearing in later years included increasing permeability of the dam, damage to the face masonry, thermal stressing of the parapet, and increasing seepage under and around the dam. The greatest permeability was measured in the subsoil of the barrage sides. Comprehensive grouting and drainage procedures were necessary to renew the sealing of the dam and subsoil and to control water pressure distribution in the dam and foundation joint. A work, drainage, and control gallery was constructed at the bottom of the dam wall for grouting. In addition, the head of the dam wall was compressed from above. Drainage bores were laid out at 1-m intervals to reduce water pressure. The crown of the dam wall was also renovated. A pendulum sounding lead and three single extensometers were installed to measure slippage, and control bores were drilled to measure bottom pressure and seepage. Analysis of slippage measurements made before and after renovations showed greater horizontal slippage after renovation and suggested that compression work had caused an irreversible slippage of the foot of the wall 3-5 mm toward the air side. However, in general, water-level dependent distortion was reduced by the renovations. It was concluded that the dam crown had become stiffer as a result of compression. The drainage system was successful in both removing water and reducing bottom pressure, the latter being important for the shock and slip resistance of the dam. (Gish-FRC)

OPTIMAL RISK-BASED HYDRAULIC DESIGN OF BRIDGES,
Nevada Univ. System, Reno. Dept. of Civil Engineering.
Y.-K. Tung, and L. W. Mays.
Journal of the Water Resources Planning and Management Division, Proceedings of the American Society of Civil Engineers, Vol 108, No WR2, p 191-203, June 1982. 8 Fig, 5 Tab, 13 Ref.

Descriptors: *Hydraulic design, *Bridge design, *Flood damage, Hydraulic structures, Optimization, Risks, Embankments, Leaf River, Hattiesburg, Mississippi, Model studies, Hydrologic models, Highways, Damage, Cost analysis, Backwater, Erosion, Bank erosion, Design criteria, Construction costs.

Hydrologic uncertainties annd socioeconomic effects are incorporated into the hydraulic design of highway bridges to determine the best design for the lowest cost. Using this method, bridge openings and embankment heights can be chosen to avoid overdesign. The cost components involved in risk-based hydraulic design of bridges are construction cost, flood damage cost, backwater damage cost, traffic interruption cost, and embankment repair cost. The optimization technique, the Hooke-Jeeves pattern search, is applied to design of a bridge on the Leaf River near Hattiesburg, Mississippi. Results show that the optimal bridge openings are the same length for the various probability models (normal, lognormal, Gumbel, Pearson III, log-Pearson III, and composite) and parameter estimation procedures, but the embankment heights vary by 1.8 ft. In this example the jacknife and bootstrap methods produce nearly the same optimal solutions. Construction costs were computed at $217,800 and expected annual damage costs from $55,000 to $110,800 depending on the hydrological probability model used. (Cassar-FRC)

PROBLEMS IN TUNNELLING BY PIPE JACKING AT TILEHURST,
Thames Water Authority, London (England).
S. H. Shurlock.
Journal of the Institution of Water Engineers and Scientists, Vol 36, No 2, p 151-153, March, 1982. 2 Fig.

Descriptors: *Tunnel failure, *Pipe jacking, Tunnel construction, Tunneling, Reading, England, Tilehurst.

Pipe jacking was the technique chosen for a 130 m tunnel project, part of a new outlet system from the Tilehurst service reservoir at Reading, England. The tunnel drive began through stiff blue London Clay. After 10 m brown clay appeared and at 24 m the face collapsed, dumping 3 cu m of gravel and soft clay plus a large quantity of water. The blue clay layer totally disappeared and wet conditions prevailed thereafter. After 37 m into the tunnel some joints were broken or displaced, and gravel and water became a constant problem. Of 54 joints, 19 were visibly damaged and 6 others showed groundwater inflow. The tunnel varied from a straight line by + or - 72 mm in level and + or - 84mm in line. Direction changes reached the 1 degree maximum recommended deflection. A welded steel lining was eventually inserted to repair the damage. The actual tunnel cost was 112,000 pounds vs. the planned 72,000 pounds. Several conclusions were reached from this experience: (1) test boreholes should have been much closer together, (2) pipe jacking is a good procedure, but the joints are a major weakness, (3) existing techniques are suitable for short drives but not adequate for long drives unless very good conditions prevail, and (4) apparently sound joints can be badly spalled on the outside. (Cassar-FRC)

THE APPLICATION OF MICROCOMPUTERS TO THE DESIGN OF STORM SEWER SYSTEMS FOR SMALL AREAS,
Sunderland Polytechnic (England). Dept. of Civil Engineering.
B. Archer.
Journal of the Institution of Water Engineers and Scientists, Vol 36, No 2, p 113-117, March, 1982. 5 Ref.

Descriptors: *Sewer systems, *Pipes, *Drainage systems, Computers, Design criteria, Rainfall intensity, Urban drainage, Storm sewers.

Microcomputers can advantageously be used to design storm sewer systems. Charts and tables for pipe sizing and for rainfall intensity are replaced by rapid calculations from the basic equations. Pipe sizes are determined within seconds, compared with the several hours necessary for manual methods involving tables. Effects of changing depths, pipe inverts, pipe lengths, or areas to be drained can be quickly determined. An appendix describes the outline flow chart for the prgrams, lists the program, and illustrates use of the program. (Cassar-FRC)

MAJOR FACTORS IN SEWER VENTILATION,
Newcastle upon Tyne Univ. (England). Dept. of Civil Engineering.
M. B. Pescod, and A. C. Price.
Journal of the Water Pollution Control Federation, Vol 54, No 4, p 385-397, April 1982. 10 Fig, 9 Tab, 4 Ref.

Descriptors: *Sewer systems, *Ventilation, *Air circulation, Temperature effects, Corrosion, Hydrogen sulfide, Dissolved oxygen, Corrosion control.

As part of an effort to develop a design to produce a maximum ventilating air flow within a sewer system having ventilation stacks without using mechanical means, an investigation of the major factors affecting naturally-occurring air flows in sewers and undertaken. The five factors considered to be the major contributors to sewer ventilation are the action of wind passing across the ventilation stack, the friction at the air-water interface resulting from the wastewater flowing down the sewer (wastewater drag), the rise and fall of the wastewater level, temperature differentials between the air and the sewer, and differences in the barometric pressure across various parts of the system. The influence of the last three factors can be treated in an analytical manner by representation in terms of the volume of air turnover produced by the rise and fall of the wastewater, having either assumed or measured a pattern of flow, or as an additional driving pressue head in the cases of the temperature and baromeric pressure differentials. Full-scale ventilation stacks were tested in a low-velocity wind tunnel using various terminals for the educt stack to try to find a stack shape which would maximize the wind across stack effect. The wastewater drag effect was investigated through measurement of air velocities using a gas tracer technique. The wind tunnel tests resulted in the identification of extraction rates that can be produced by low wind speeds at the educt stack location from which a typical daily or weekly extraction rate can be estimated under natural conditions. The wastewater drag effects appear to be subservient to wind extraction. The variability of wastewater level in a sewer system results in addition fresh air being drawn in during a fall in level and sewer air being exhausted during a rise in level. Temperature differentials in the summer can be expected to increase resistance to air movement in the sewer. Significant differences in barometric pressure would not be expected to arise during the summer months in the United Kingdom. (Carroll-FRC)

THE CHOICE OF HYDRAULIC ENERGY DISSIPATOR FOR DAM OUTLET WORKS BASED ON A SURVEY OF PROTOTYPE USAGE,
P. J. Mason.
Proceedings of the Institution of Civil Engineers, Part I, Design and Construction, Vol 72, No 2, p 209-219, May, 1982. 4 Fig, 44 Ref.

Descriptors: *Energy dissipation, *Dam design, *Outlets, Flip buckets, Hydraulic design, Ski jumps, Jets, Damage, Erosion, Cavitation, Hydraulic jump, Discharge capacity, Rock basins, Baffles.

A survey was conducted at 370 prototype energy dissipators from dams in 61 countries to establish the ranges of head and flow for which designers have selected various dissipators and at which problems are most likely to occur. Rock basins are predominantly used for head differences below 30 m. Damages are most likely at head differences above 40 m or in the presence of weak rocks. Simple hydraulic jump stilling basins in concrete are commonly used at head drops of 1-10 m and 30-50 m. At 50 m or above special techniques and materials are necessary to avoid failure. Baffle basins, generally trouble-free over a head drop range of 10-30 m, show erosion, cavitation, and complete destruction at higher head differences. Free trajectory jet dissipators (simple overfalls, ski jumps, and flip buckets) are relatively problem-free for almost any head drop, over 200 m in some cases. A few reported cases of erosion are related to unacceptable scour in the downstream plunge pool. One case of cavitation erosion is documented. A graph shows that free trajectory jet dissipators are rarely used in the range to the left of a line defined by a head drop of 8 m and discharge capacity of zero and a head drop of 48 m and discharge capacity of 10,000 cu m per sec. Results of this survey are summarized on a graph revealing the most practical energy dissipator designs for different combinations of head drop and discharge capacity. (Cassar-FRC)

THE KIELDER TRANSFER WORKS,
D. J. Coats, N. S. M. Berry, and D. J. Banks.
Proceedings of the Institution of Civil Engineers, Part 1, Design and Construction, Vol 72, No 2, p 177-208, May, 1982. 24 Fig, 3 Tab, 38 Ref.

Descriptors: *Pipelines, *Tunnel construction, *Water transfer, Tunnel linings, Kielder Dam, *England, Tees River, Wear River, Tyne River, Water resources development, Reservoirs, Weirs, Pumping plants, Dam construction, Aqueducts, Hydraulic valves.

The transfer works of the Northumbrian Water Authority Kielder water scheme connects the water stored at Kielder Water on the River North Tyne with the rivers Wear and Tees for purposes of flow regulation and water abstraction. Operations are scheduled to begin in 1982. Water abstracted from the River Tyne at the Riding Mill pumping station 56 km downstream from Kielder Dam will flow through 6.2 km of pump main and 32 km of a gravitational system, with connections at the rivers Wear and Tees. The Airy Holm headpond, about 8 km from Riding Mill, permits correction of imbalances between rates of pumping and tunnel discharge. At Riding Mill weirs have been installed to increase the water depth and provide storage. The pumping station contains 12 pump units, each with 91,000 cu m per day capacity. The 65 m long intake has a maximum intake velocity of 0.3 m per sec. The steel pump main rises about 200 m. Air venting houses and access places for cleaning are built into the pipeline. The Airy Holm dam was built with a 180 m long and 20 m high concrete gravity section in the central portion, with earth embankments on the flanks to give a dam 500 m long. A concrete-lined gravity flow tunnel with air shafts and discharge valves at the rivers complete the transfer works. Steel pipe 2.89 m in diameter carries the aqueduct over two river valleys. There are no in-line valves, all control being effected by the discharge valves at the rivers Wear and Tees. The discharge structures are largely underground. (Cassar-FRC)

THE KIELDER WATER SCHEME,
D. J. Coats, and N. J. Ruffle.
Proceedings of the Institution of Civil Engineers, Part I, Design and Construction, Vol 72, No 2, p 135-147, May, 1982. 5 Fig, 1 Tab, 5 Ref.

Descriptors: Water resources development, *Flow regulation, *Water transfer, Kielder Reservoir, Tyne River, Wear River, Tees River, *England, Reservoirs, Flow augmentation, Recreation, Environmental effects, Water storage, Industrial water, Water supply, Aeration, Water quality control, Public relations, Fish.

The Kielder water scheme was constructed during 1975-82 in northeast England to regulate the Rivers Tyne, Wear, and Tees for supplying water to a region with rising industrial water usage. It is under the jurisdiction of the Northumbrian Water Authority. Kielder Water, a 188 million cu m reservoir on the River North Tyne, provides water for regulation of all three rivers via a north-south transfer works. This consists of a weir and pumping station on the River Tyne, 6.2 km of 2 m diameter pumping main, 32 km of 2.9 m diameter tunnel, and a small head pond at Airy Holm. Aeration was installed in the reservoir to prevent thermal stratification and resulting problems from Fe and Mn compounds, sulfides, and ammonia. During construction truck traffic was limited to an approved route. Public relations with the community remained good throughout construction because of Liaison Officer, located near the headworks, was available for resolving problems and for guiding visitors. Prehistoric, Roman, and medieval sites were investigated before innundation, and the historic 1862 Kielder Viaduct was preserved. The irregularly shaped 1086 ha reservoir, set in coniferous forest, is available for recreational activities such as fishing, boating, camping, and other activities. Since much salmon spawning gravel was inundated, a fish hatchery has been built upstream to release 160,000 juvenile salmon per year. (Cassar-FRC)

THE KIELDER HEADWORKS,
D. J. Coats, and G. Rocke.
Proceedings of the Institution of Civil Engineers. Part I, Design and Construction, Vol 72, No 2, p 149-176, May, 1982. 21 Fig, 2 Tab, 4 Ref.

Descriptors: *Dam construction, *Reservoirs, *Embankments, Kielder Dam, Bakethin Dam, England, Earth dams, Weirs, North Tyne River, Culverts.

Construction details of the Northumbrian Water Authority's Kielder Water are described. This reservoir is part of a scheme to regulate the River Tyne in northeast England. Construction work started in 1975 with relocation of a highway. Preliminary site studies revealed an underlying rock sequence of sandstones, shales, mudstones, and coal seams. The superficial deposits were glacial boulder clay and alluvial material. Bakethin Dam, a 17 m high and 165 m long submerged sand and gravel weir, was built within the main reservoir to retain water in the upper reaches for amenity reasons when Kielder Water is drawn down. The draw-off works consists of a reinforced concrete culvert about 15 m wide containing a 1900 mm diameter scour pipe, a 2000 mm diameter draw-off pipe, an access roadway, instruments, and a valve tower. Construction details and diagrams of the clay core, earth-fill Kielder Dam are described. The dam is 1140 m long, 52 m high. The reservoir is 11.1 km long, 1086 ha in surface area, and stores 188 million cu m of water. Impounding started on December 15, 1980. (Cassar-FRC)

BRIDGING THE WATER SUPPLY GAP,
Bogert (Clinton) Associates, Fort Lee, NJ.
W. Wheeler, and E. Cruz.
Public Works, Vol 113, No 3, p 62-63, March, 1982.

Descriptors: *Pipelines, *Water supply, *Water transfer, Construction, New York, New Jersey, Drought, Bridges, George Washington Bridge, Expansion, Water shortage.

Water from New York's supply system was diverted to drought-stricken northeast New Jersey by a 10,5000 ft long, 24 inch diameter steel pipeline built acress the George Washington bridge over a 4-month period. It was completed on July 1, 1981. The pipeline has a capacity of 20 mgd. Special problems included 9 ft. of expansion and constraction and a 7 ft. sway, heavy vehicular traffic on the bridge (250,000 vehicles per day), the age of the bridge (50 years), and procuring the necessary materials, Since custom expansion joints could not be disigned and made within the time limits, units with 10 inch axial movement each were combined, five for the 48 inch movement at the main span of each tower and two for the 18 inch movement at the side spans. The pipeline is anchored to the bridge only at the center, the unanchored part floating on roller guides. If desired, the pipeline may be dismantled and stored in an abandoned tunnel. (Cassar-FRC)

TEXAS GULF COAST PROJECT ANSWERS VITAL WATER NEED,
Southwest and Texas Water Works Journal, Vol 64, No 2, p 6-7, May, 1982.

Descriptors: *Water supply, *Pipelines, *Reservoirs, Dams, Point Comfort, Texas, Earth dams.

A pipeline and reservoir system is currently under construction to supply water to the Point Comfort region near Houston, Texas. The project consists of the earth-filled, 1.3 mile long, 58 ft high Palmetto Bend Dam, the 11,000 acre Lake Texana, one mile of 36 inch steel above-ground transmission line, and 13 miles of underground pipeline. The dam is constructed with specially covered slopes and extra steel anchors in the concrete spillway to protect against hurricane damage. Initially the reservoir will provide 20,000 acre ft of water per year to the region. (Cassar-FRC)

STANDARD PRACTICE FOR INSERTION OF FLEXIBLE POLYETHYLENE PIPE INTO EXISTING SEWERS--ASTM F585-78.
Water Services, Vol 86, No 1033, p 106-108, March, 1982. 2 Fig, 6 Ref.

Descriptors: *Pipelines, *Sewer systems, *Rehabilitation, Plastics, Standards, Excavation, Inspection, Flow characteristics, Design criteria, American Society for Testing and Materials.

The standard practice reprinted and adapted here (ASTM F585-78) describes the design and selection considerations and installation procedures for construction of new sanitary and storm sewers by inserting polyethylene pipe through existing pipe and along the previously existing line and grade. This procedure minimizes traffic disruption, surface damage, and restoration, with little or no interruption of service. General guidelines emphasize that existing pipe conditions must be determined to see if the pipe insertion is feasible. Generally, piping with outside diameter 10% smaller than the original sewer is practical. To account for external loading, formulas are given for calculating the standard dimensiion ratio of pipe required and the minimum allowable radius of curature for any size and weight of pipe. Other subjects treated under design and selection characteristics are anchoring and encasement, pulling force and length. Procedures are detailed for inspection and cleaning; excavation; storage, handling, and joining of polyethylene pipe; insertion and termination; finishing and restoration; and inspection and acceptance. OUT OF SIGHT--OUT OF MIND.
Civil Engineering (London), p 45, 47, May 1982. 1 Tab, 2 Ref.

Descriptors: *Tunnel linings, *Rehabilitation, *Sewer systems, Linings, Polyester resins, Resins, *England.

LIBRARY U. OF I., URBANA-CHAMPAIGN

Rehabilitation of aging sewers in England has generally been limited to repairing acute failures with the limited available funds. Relining with polymers has been receiving increased attention in spite of its high initial cost. A comparison of the costs for installing several types of polyester concrete, glass reinforced polyester, and other methods showed that these relining methods are generally 4-5 times more expensive than hand repointing. Since relining is still in its infancy, many contractors use it only in sections unsuitable for digging. The problem of detecting voids around the barrel of the sewer is being studied. Base-band radar and gamma ray backscatter have been successful in locating dry voids. Closed-circuit television has also been used to view the condition of the sewer interiors. (Cassar-FRC)

CANAL TUNNEL REPAIR OPTIONS.
Civil Engineering (London), p 56, 58, May, 1982. 1 Fig.

Descriptors: *Tunnel linings, *Canal linings, *Rehabilitation, Linings, Concrete construction, Blisworth Tunnel, *England.

The 2812 m long brick lined Blisworth tunnel, part of Britain's 2000 mile canal system, has been closed to boat traffic since October 1980 because of failures and deterioration. The option chosen for rehabilitation of the 200-year-old structure involves removal of a section of existing tunnel lining and some of the surrounding material and replacing this with an external segmental concrete lining. Although the 4.25 million pound cost is the most expensive of the five renovation alternatives in the short term, maintenance is expected to be minimal. In addition the tunnel's 15 ft width will not be further reduced, retaining the 2-way traffic pattern. Work is expected to start in late 1982. (Cassar-FRC)

SEWER RENEWAL BY PIPE INSERTION.
Civil Engineering (London), p 66-67, May, 1982.

Descriptors: *Sewer systems, *Linings, *Rehabilitation, Polyethylene, Pipes, Plastics.

Insertion of polyethylene pipe into aging sewers provides total renewal for structurally unsound systems as well as corrosion resistance. The winching method of insertion can be used for lengths up to 500 m without diverting flows. Hydraulic jacking needs an insertion pit only 1 m longer than an individual section. However, it is more expensive because smaller lengths and more joints are required. Flows must be diverted. In high water table regions no dewatering or trenching is necessary. There are minimum disturbances to agricultural crops, buildings, and traffic. The small decrease in finished pipe diameter is counteracted by the low friction, infiltration resistant smooth plastic lining. (Cassar-FRC)

REDEVELOPMENT OF AQUEDUCT CROSSING OF MANCHESTER SHIP CANAL AND RIVER MERSEY,
R. J. Baty.
Journal of the Institution of Water Engineers and Scientists, Vol 36, No 2, p 97-112, March, 1982. 6 Fig.

Descriptors: *Aqueducts, *Tunnel construction, Pipelines, Tunnel linings, Frozen ground, Manchester Ship Canal, Mersey River, Vyrnwy Aqueduct, Diversion structures, *England.

The aqueducts crossing the Manchester Ship Canal and the River Mersey were first put into service in 1892. The section under the canal was a 3658 mm diameter brick tunnel, built before the ship canal was filled with water. The section under the river was a 2748 mm diameter tunnel built of cast-iron sections bolted together. Within these tunnels pipelines were installed in 1892 and 1905. A third pipeline, added in 1938, fit within the canal tunnel. However, in order to pass under the river it was necessary to construct a second tunnel crossing the Mersey. Water resources developments during the 1960's required further modifications to the system. Deterioration of some of the old pipe necessitated remedial work. The North West Water Authority accomplished this by linking the two existing river crossing tunnels and replacing the pipes with a single pressure lining occupying the full area of the tunnel. This paper discribes the reconstruction work in detail. After construction of a temporary diversion pipework, the connecting shaft was built using a local ground freezing technique and precast concrete segments. The old brickwork and cast-iron segment tunnels, in excellent condition, were lined with pressure-resistant steel 16 mm thick in 6 and 3.6 m lengths. At the tops of the shafts shear walls penetrating the bedrock were constructed to compensate for thrust forces. The project began in October 1978 and was completed in spring 1981. (Cassar-FRC)

PLANNED MEASURES FOR WATER REGULATION CONSTRUCTING THE NEW MUNICH AIRPORT (GEPLANTE WASSERWIRTSCHAFTLICHE MASSNAHMEN BEIM BAU DES NEUEN FLUGHAFENS FUR MUNCHEN),
Oberste Baubehorde im Bayrischen Staatsministerium des Inneren, Munich (Germany, F.R.).
J. Bauer.
Wasserwirtschaft, Vol 72, No 1, p 6-11, 1982. 7 Fig.

Descriptors: *Airports, *Hydraulic engineering, *Diversion ditches, *Water table, *Wastewater facilities, Storm wastewater, Storm sewers, Drainage ditches, Drainage effects, Environmental effects, Construction, Engineering, Agriculture, *West Germany, Drinking water, Soil mechanics, Geology.

Water-related problems caused by the site selection for the new Munich (West Germany) airport and the solutions to these problems are described. The site is at the northern edge of the Munich gravel plain, with a topsoil that was once peat but is now used for intensive agriculture. Under the permeable quaternary gravel lies an impermeable layer that separates the groundwater into upper and lower regions, the lower region being used for drinking water. It was important that airport construction not disturb this arrangement. Several small streams running from southwest to northwest would be diverted around the airport by channels built to a design flood of 20 years, the main outfall ditch being built to a 100-year flood. The airport would also be protected by a dike along the channel walls. The groundwater table would be lowered by means of drainage ditches to prevent frost formation on the runways. In order to avoid a negative effect on the surrounding agricultural lands, a plan was chosen such that the lowering of the water table is only noticeable to the south (upstream) of the airport, and then only after a long dry spell; in order to avoid negative effects to the north, water collected in the drainage ditches would be allowed to seep out through 120 vertical shafts along the northern perimeter of the airport. Stormwater would be channeled into a combined system for domestic and industrial wastewater as well as stormwater from streets and parking lots and a separate stormwater system for lightly polluted stormwater and stormwater overflow. The construction of an underground rail line connecting the airport with the city posed the problem of avoiding a build-up of groundwater, since the tunnel would cut off its flow. It was decided to collect water on the upstream side in horizontal filters and carry it to downstream horizontal filters by means of control shafts along the tunnel walls which would be connected to deep siphons. HYDRAULIC MODEL STUDIES - YELLOWTAIL AFTERBAY DAM SLUICEWAY,
Bureau of Reclamation, Denver, CO. Engineering and Research Center.
M. F. Young.
Report GR-82-5, July, 1982. 47 p, 24 Fig, 2 Tab, 3 Ref.

Descriptors: *Supersatuation, *Hydraulic models, *Dam effects, *Gases, *Flow deflectors, *Sluiceways, Model studies, Fishkill, Dam design, Stilling basins, Flow velocity, Debris, *Montana.

Yellowtail Afterbay Dam is on the Big Horn River 3.5 km below Yellowtail Dam and Powerplant. Releases from the afterbay dam are used to provide uniform daily flow in the Big Horn River, leveling the peaking power generation from Yellowtail Powerplant. At times, gas supersaturation has occurred downstream from Yellowail Afterbay Dam, resulting in serious fish kills. A 1:24 scale model of Yellowtail Afterbay sluiceway was constructed to study the placement of flow deflectors designed to keep the water jets issuing from the sluiceway gates near the tailwater surface. Deflector plates installed on the curved invert of the sluiceway will reduce jet submegence, a cause of supersaturation. Measurements show no subatmospheric pressures present on the flow deflector lips. Waves within the stilling basin will be larger with the deflectors in place than with the existing configuration, while waves outside the basin will be the same size or smaller. With the flow deflectors in place, the largest velocities, and therefore the most flow, occur near the surface where the pressure is close to atmospheric. With the deflectors in place, material will not be brought back into the basin, although any material thrown into the basin will remain there. (Moore-SRC)

ON CONDUCTING THE MODIFIED 'SLUG' TEST IN TIGHT FORMATIONS,
Geological Survey, Reston.
C. E. Neuzil.
Water Resources Research, Vol 18, No 2, p 439-441, April, 1982. 5 Fig, 3 Ref.

Descriptors: *Well hydraulics, *Hydraulic properties, *Test wells, *Rock mechanics, Permeability coefficient, Storage coefficient, Equilibrium, Head loss, Compressibility, Transmissivity, Wells, Hydraulics, Shales, Pumps, Slug test.

An improved version of a modified 'slug' test (Brdehoeft, J. D., and Papadopulos, S. S., 'A method for determining the hydraulic properties of tight formations, 'Water Resources Research, Vol. 16, No. 1, p 233-238, 1980) is presented. With the original method, the borehole is filled with water prior to the test, usually resulting in significant transient flow; the necessary condition of approximate equilibrium is therefore not met. Additionally, while the compressibility of water (Cw) should be used to account for storage change in the shut-in well, actual compressibility in this well can be larger than Cw. With the improved method, the borehole is filled with water and two packers are placed close together. Pressure is monitored by two transducers, one between the packers and one below the lower packer. The test section is shut in, and pressures in both sections are monitored until near-equilibrium exists. To compute compressibility in the well, the volume of water pumped in to achieve the pressure 'slug' must be known; this is calculated by measuring the amount of water pumped from a container at the surface. The possibility of generating a suction in the uppermost part of the shut-in volume and the creation of a free surface is prevented by locating the valve used to shut the well near the packers. (Gish-FRC)

BICYCLE-SAFE GRATE INLETS STUDY; VOLUME 5 - HYDRAULIC DESIGN OF GENERAL SLOTTED DRAIN INLETS,

Water and Power Resources Service, Denver, Colorado.
C. A. Pugh.
Federal Highway Administration Report FHWA/RD-80/081, October 1980. 145 p, 120 Fig, 6 Tab, 1 Ref. PO-5-3-0166.

Descriptors: *Inlets, *Hydraulic design, *Hydraulic models, *Storm drains, Model studies, Flow characteristics, Interception, Slopes, Flow capture.

Hydraulic tests and analysis were conducted to generalize the hydraulic design of slotted drain installations. Slotted drains with solid vertical spacers at 6-in spacing were used in all testing. Slot widths of 1, 1.75, and 2.50 inches and slot lengths of 8, 24 and 48 ft were used. The tests at slot length of 8 and 24 ft were conducted to determine efficiencies over a range of flows. At 48 ft, testing was limited to total flow capture lengths. In order to cover a range of slope conditions, logitudinal slopes of 0.005, 0.02, and 0.09 were tested at cross slopes of 1/16, 1/32, and 1/64. Back slopes of 1/16 and 1/24 were tested at a curb distance of 15 in for all installations. All installations were also tested with the curb adjacent to the slot. A series of 4 or 5 discharges ws tested for each condition. For most field conditions weir flow controls the total capture length. Based on data from these studies, new equations were developed to cover a wider range of conditions. Back slope does not affect the partial flow interception efficiency in the range measured. CANALS IN SAND CHANNELS,
S. Kh. Abal'yants.
Hydrotechnical Construction, Vol 15, No 8, p 471-475, 1981. 1 Fig, 2 Tab, 19 Ref. Translated From Gidrotekhnicheskoe Stroitel'stvo, No 8, p 28-30, August, 1981.

Descriptors: *Canal design, *Mathematical studies, *Flow characteristics, *Hydraulics, *Channel flow, *Channel morphology, *Flow velocity, Canal construction, Design criteria, Stable channels, Canals, Flow friction, Mathematical equations, Roughness coefficient, Chezy equation, Sand, Canal linings, Channel erosion.

The mobility of material in a canal constructed in noncohesive sand soils is substantially affected by the turbulence of the flow, a factor not adequately reflected in the working formulas. Preliminary data indicates that Studenichnikov's formula for the critical velocity with a slightly reduced numerical coefficient and replacement of depth by the hydraulic radius without corrections for the channel shape is applicable for sands with a particle size to 1.5-2.0 mm. Equations were formulated establishing the existence of a stable quasihomogeneous flow whose conditions can be regarded as an expression of minimum energy dissipation. The influence of the roughness coefficient on the equations' parameters is discussed. Other factors such as traveling surges, wind and ship waves, local curves of the route, infiltration, nonuniform strength properties of the soils, and special conditions of the winter regime should also be considered when designing and constructing new canals. CAVITATION PROBLEMS IN HIGH-HEAD INSTALLATIONS (KAVITATIONSPROBLEME IN GRUNDABLASSEN).
Karlsruhe Univ. (Germany, F. R.). Inst. fuer Hydromechanick.
E. Naudascher.
Wasserwirtschaft, Vol 72, No 3, p 104-110, 1982. 14 Fig, 27 Ref. English Summary.

Descriptors: *Cavitation, *Design criteria, *Dams, Fluid mechanics, Erosion, Bottom outlets, Mathematical equations, Water currents, Vortices, Eddies, Flow, Turbulent flow, Aeration, Shear, Pakistan, *High-head installations.

The significance of cavitation for high-head installations was demonstrated by the collapse of a bottom outlet of the Tarbela Dam in Pakistan in 1974, which was caused by erosions of up to 5 m under the inlet structure and hollowing out of the piers. Damage from cavitation sets in principally when, in addition to the usual preconditions, vortex formations occur. Equations for calculating the cavitation figure (Ka), an estimate of the onset of cavitation, its extent and consequences, and for the size of Ka at the onset of cavitation (Ka krit) are given. Areas particularly susceptible to caviation are current boundaries with crooked edges or breaks. Shear zones form along the breaks in which turbulent vortices form. An equation to calculate Ka krit along smooth and rough walls and in free shear currents is given. Other conditions under which cavitation occurs are discussed. Design principles for avoiding cavitation are the streamlining of flow passages to keep pressure and velocity of the current within acceptable limits, the transfer of zones favoring cavitation to the inner areas of the current so that the walls are protected from erosion, and artificial aeration as well as the fostering of spontaneous aeration. Examples of all these principles are described and illustrated, and special protection measures and extraordinary operating conditions are discussed. Further research on the behavior of currents is called for. (Gish-FRC)

DESIGN FLOOD AND HYDROLOGICAL RISK FOR SPILLWAYS OR RESERVOIRS AND FLOOD PROTECTION BASINS (BEMESSUNGSHOCHWASSER UND HYDROLOGISCHES VERSAGENSRISIKO FUR TALSPERREN UND HOCHWASSERRUCKHALTEBECKEN),
Karlsruhe Univ. (Germany, F. R.). Inst. Wasserbau III.
E. J. Plate.
Wasserwirtschaft, Vol 72, No 3, p 91-97, 1982. 6 Fig, 14 Ref. English Summary.

Descriptors: *Design criteria, *Reservoirs, *Flood protection, *Dam failure, *Spillways, Floods, Flood control, Flood plain management, Risks, Reliability theory, Mathematical analysis, Design standards, Standards, Maximum probable floods, Hydraulic design, Reservoir design, Costs, Acceptable risk.

A concept for improving the design of spillways is presented, which can be used to supplement the rules of German Standard DIN 19700 for reservoirs and flood protection basins. The Standard is not far-reaching enough because its only design criterion is the probability of flood waters exceeding reservoir capacity, whereas the probability of dam overflow should also be considered, since there is no direct connection between the two. The first stage of the concept consists of calculating the overflow probability, which is also the probability of dam failure due to hydrological causes, by means of Freudenthal's reliability integral. The use of reliability theory leads to significantly longer recurrence intervals of overflow than those previously calculated. Sample calculations are given for a small potable-water reservoir, giving a recurrence interval of 34,528 years, and for a small flood protection basin, giving an interval of 642 years. Whether the small interval of the second example is significant or not depends on the damage that would be caused by overflow, and this leads to the second stage of the concept, that of acceptable risk. Rather than measuring total damage done by one flood, hydrological risk should be understood as a figure proportional to the expected value of damage expected per year following overflow. Methods of determining this are given, though as yet no concept exists to measure the acceptable level of non-monetary damage. This total concept can aid in economical design and help satisfy public demand for knowledge or risks to which they are subjected. (Baker-FRC)

CONFLUENCE OF TWO JETS CREATED BY TWO PARALLEL SEGMENT GATES OF A BOTTOM OUTLET (SCHUSSSTRAHL-ZUSAMMENFUHRUNG BEI EINEM GRUNDABLASS MIT NEBENEINYANDERLIEGENDEN SEGMENTSCHUTZEN).
Technische univ., Berlin (Germany, F.R.). Inst. fuer Wasserbau und Wasserwirtschaft.
H. J. Hoch.
Wasserwirtschaft, Vol 72, No 3, p 110-114, 1982. 11 Fig, 6 Ref. English Summary.

Descriptors: *Jets, *Bottom outlets, *Gates, Model studies, Reservoirs, Plumes, Hydraulic design, Design criteria, Hydraulic engineering, Cavitation, Trails, Water currents, Tunnels, Irrigation, Irrigation engineering, *Sri Lanka, Rangenigala Reservoir.

Model studies were conducted to examine the confluence of jets behind two parallel segment gates in the bottom outlet of the Rangenigala Reservoir, Sri Lanka. The bottom outlet also functions as an irrigation outlet, which necessitated the construction of two gates at the end of the pressure tunnel for operational safety. The result of this is separation of flow by a dividing wall which for static reasons must be 2.6 m wide. Because of the high velocity (43.2 m/sec) of the two jets, which converged at a relatively large angle behind the wall, water plumes of up to 15 m in height ensued under certain conditions when an elliptical model wall was used. Theoretical calculations and reference to previous experiments led to a model in which pier width was kept constant at 2.6 m under the segment gates. Though the effect of jets crashing into each other when both gates were equally open and against the opposite channel wall when the gates were open at different levels was reduced by 70%, and a narrow plume of only 5 m in geight was formed, these conditions were not adequate to ensure the safety of the nonpressure tunnel. For this reason an extension to the wall was built, 35 m in length, with a height of 1.9 m at the wall, diminishing to 0.5 m. In this way the lower portion of the jet was channeled, while the upper portion gradually broadened out along the extending trail, and in the area of jet convergence water depth and Froude number were constantly changing. This trail was an improvement on previously built rails in that its side walls ran at an angle of 1 degree so that the flow cross-section of the jet broadened continuously, its form was prismatic to fix separation of flow along the edges, and it had a box profile to allow aeration of the trail end for the avoidance of cavitation. HYDRAULIC JUMP, AIR ENTRAINMENT AND SLUG FLOW IN BOTTOM OUTLETS (WECHSELSPRUNG, LUFTEINTRAG UND SCHWALLFORMIGER ABFLUSS IN GRUNDABLASSEN),
Technische Univ., Munich (Germany, F. R.). Versuchsanstalt Fuer Wasserbau.
J. Knauss.
Wasserwirtrschaft, Vol 72, No 3, p 115-119, 1982. 6 Fig, 1 Ref.

Descriptors: *Bottom outlets, *Air entrainment, *Hydraulic jump, *Closed-conduit flow, *Slug flow, Fluid mechanics, Flow, Flood protection, Vibrations, Supercritical inflow, Submerged outflow, Ventilation, Model studies, Design criteria, Hydraulic design, Hydraulic engineering, West Germany.

Conditions under which slug flow can occur and possible remedies for the situation are discussed with reference to operational installations planned for the flood protection basin at Schonstadt an der Itz, West Germany. Slug flow can arise in closed channels when submerged outflow conditions act on supercritical inflow so that a hydraulic jump fills the conduit. The consequences of this are dynamic stress reversals in the conduit, pulsating and discontinuous flow, and the danger of vibrations. Model studies showed that the planned positioning of the spillway and two bottom outlets close together on top of one another in a single casing under the dam would lead to slug flow due

LIBRARY U. OF I., URBANA-CHAMPAIGN

to a hydraulic jump entraining air within the conduit. Two remedies were possible, changing the outlet route or installing ventilation units to remove the entrained air. Because in this case air entrainment was unavoidable due to gate position and accumulation in the channel, it was decided to build two ventilation units in each bottom outlet. In this case the bottom outlets had an inclination of 5% and a cross-section of 2 x 2 m; the model studies also investigated channel inclinations of 3%, 6% and 12% with prismatic cross-sections of 20/15 cm (compact) and 20/30 cm (superelevated). Installation of ventilation systems may be avoided by designing bottom outlets with an appropriate vertical route for the channel to prevent accumulation. (Gish-FRC)

CANADIAN WAVE CLIMATE STUDY: ORGANIZATION AND OPERATION,
J. R. Wilson, and W. F. Baird.
Marine Sciences and Information Directorate, Manuscript Report Series No 59, 1981. Department Of Fisheries and Oceans, Ottawa, Ontario. 26 p, 9 Fig, 1 Tab, 31 Ref.

Descriptors: *Wave height, *Wave propagation, *Data collections, *Design criteria, *Breakwaters, Canada, Wave action, Wave crest, Wave direction, Waves, Kinematic waves, Wind waves, Buoys, Structural engineering, Port facilities, Histograms, Data acquisition, Data interpretation, Design standards, Sea walls.

The Canadian Wave Climate Study was established in 1968 to provide information to assist the design of marine facilities (e.g., deep water ports, breakwaters, offshore structures), and has led to wave data collections at about 200 locations in marine and inland waters on both the east and west coasts of Canada. Recent activities have led to the development of a standard analysis procedure and a set of data presentations useful to design engineering. These activities are delineated, along with the instrumentation employed, its reliability, and its operation characteristics. Specifically, the performance and calibration of the basic instrument employed, the waverider buoy, are described. Calibrations were carried out with a variable-speed mechanical oscillator capable of rotating a waverider in a fixed plane at a number of selectable fixed frequencies. Data control and analysis are discussed, and examples of data reporting products are given (e.g., scatter diagrams, peak-period histograms, wave height exceedence diagrams, wave height time-course plots, spectrum diagrams, surface elevation traces). In addition to the standard data products, wave data are available on magnetic tape in digital form in both computed spectral and surface elevation files (covering over 300,000 records in each of these files). SEWER NETWORK ROUTING BY DYNAMIC WAVE CHARACTERISTICS,
Middle East Technical Univ., Ankara (Turkey). Dept. of Civil Engineering.
A. S. Sevuk, and B. C. Yen.
Journal of the Hydraulics Division, Proceedings of the American Society of Civil Engineers, Vol 108, No HY3, p 379-398, March, 1982. 13 Fig, 3 Tab, 12 Ref.

Descriptors: *Routing, *Sewer hydraulics, *Wave action, *Flow characteristics, Unsteady flow, Simulation anlaysis, Mathematical models, Networks.

Although flow in storm sewer networks is usually unsteady, nonuniform, turbulent, and subject to mutual backwater effects of joining sewers, it is only recently that complete dynamic wave equations capable of accounting for the downstream backwater effect have been adopted in sewer network flow simulation. Numerical schemes for solving the dynamic wave equations are computationally costly and at times unstable. The Illinois Storm Sewer System Simulation Model uses the method of characteristics to solve these dynamic wave equations. The use of this model to route unsteady open-channel flow in dendritic sewer networks is reported. Application of the model to a 48-pipe sewer system confirmed the following characteristics of unsteady open-channel flow in sewer networks: the backwater effect of the junctions cannot be ignored in modeling these systems and, under certain circumstances, reversal flow may occur; the depth-discharge relationship is not unique and a loop-type rating curve exists; and the occurrence of maximum discharge in a sewer need not, and usually does not, coincide with maximum depth. The model is also applied to the example sewer network given in an American Society of Civil Engineers Manual of Engineering Practice in order to demonstrate how a dynamic wave routing model can be used to evaluate and improve a sewer system. Although several refinements to the model are desirable, the computed results of the model presented appear to be in good agreement with the expectations based on physical reasoning. (Carroll-FRC)

DILUTION ANALYSIS FOR UNIDIRECTIONAL DIFFUSERS,
Massachusetts Inst. of Tech., Cambridge. Dept. of Civil Engineering.
E. E. Adams.
Journal of the Hydraulics Division, Proceedings of the American Society of Civil Engineers, Vol 108, No HY3, p 327-342, March, 1982. 9 Fig, 18 Ref.

Descriptors: *Diffusion coefficent, *Wastewater disposal, Cooling water, Mixing, Prediction, Mathematical studies, Powerplants, Design criteria, Flow discharge, Fluid mechanics.

Submerged multiport diffusers provide an efficient means for the rapid dilution of large volumes of wastewater discharged into ambient receiving waters. The mixing mechanics of two types of unidirectional diffusers used to discharge heated water from steam-electric powerplants into shallow, laterally unbounded receiving waters are examined. The diffusers analyzed include a coflowing diffuser, in which the discharge ports are oriented in the direction of the ambient current, and a tee diffuser, in which the discharge ports are oriented at right angles to the ambient current. An analytical theory for the dilution of a coflowing diffuser has been developed and was shown to yield good agreement with available measurements. Comparison of this theory with anlaysis governing other diffuser types indicated that the coflowing diffuser is the best choice for maximizing dilution in open receiving waters with predominant currents in one direction. The symmetrical orientation of a tee diffuser makes it the preferred choice over a coflowing diffuser when the receiving waters are characterized by weak bidirectional currents. A semi-empirical theory was used to illustrate the dependence of tee difusser dilution on ambient current speed, suggesting that the highest practical discharge velocity should be used to obtain the most efficient mixing with this type of diffuser. Comparison of dilution obtained with a tee diffuser with that expected for staged diffuser indicated that staged diffusers provide the best dilution for receiving waters with strong idirectional currents. V. M. Ponce, and F. D. Theurer.
Journal of the Hydraulics Division, Proceedings of the American Society of Civil Engineers, Vol 108, No HY6, p 747-757, June, 1982. 2 Fig, 1 Tab, 11 Ref.

Descriptors: *Channel flow, *Flood routing, Muskingum model, Model studies, Routing, *Diffusion model, Hydrographs, Streamflow.

The Muskingum diffusion model, in which the channel routing parameters are calculated based on channel and grid characteristics, is evaluated. Numerical experiments are done to provide information on the criterion for spatial resolution to preserve the accuracy of the method. For very large values of the space step, unrealistic negative flows occur. The numerical experiments show that one of the routing coefficients, C2, should be equal to or greater than 0.33 for most practical applications. The upper limit for the space step can be calculated from an equation which includes the terms Courant length, characteristic reach length, and an accuracy parameter of 2. (Cassar-FRC)

THE V-SHAPED BROAD-CRESTED WEIR,
Waterloopkundig Lab., Delft (Netherlands).
W. Boiten, and R. H. Pitlo.
Journal of the Irrigation and Drainage Division, Proceedings of the American Society of Civil Engineers, Vol 108, No IR2, p 142-160, June, 1982. 18 Fig, 4 Tab, 15 Ref.

Descriptors: *Weirs, *Discharge measurement, *Crest gages, Hydraulic stuctures, Roughness coefficient, Flow measurement, Discharge coefficient, Flow velocity, Design criteria.

The V-shaped broad-crested weir, a widely used measuring structure in irrigation and hydrologic studies, was investigated to discover the influence of free flow and submerged flow with shape angles of 90, 120, and 150 degrees and to study the thickness of the boundary layer and its effects on the discharge coefficient. A horizontal broad-crested weir was used to study the influence of the crest material. The characteristic discharge coefficient was affected by three inteacting components: boundary layer effects related to crest roughness, lateral contraction upstream and downstream of the critical section Scaling effects may be caused by boundary layer effects if the Reynolds number is less than 300,000. The Froude number in the head measurement section should not exceed 0.2-0.5. The shape angle should not be less than 60 degrees. The modular limit for V-shaped broad-crested weirs is a submergence ratio of 80% if the ratio of the energy head tocrest length does not exceed 0.45. Above this value the modular limit is reduced. Submerged flow can be calculated by introducing a drowned flow reduction factor usable for submergence ratios of 80-93%. The structure is suitable for measuring small and moderate discharges. Rules for design and application are given. (Cassar-FRC)

TURBULENT FRICTION IN A VISCOUS SUBLAYER AND IN THE TRANSITION REGION OF THE FLOW OF WATER IN A FLAT DUCT,
Ye. S. Mikhaylova, and Ye. M. Khabakphasheva.
Fluid Mechanics-Soviet Research, Vol 9, No 6, p 37-51, November/December, 1980. 8 Fig, 5 Tab, 13 Ref.

Descriptors: *Turbulent flow, *Flow friction, Hydraulics, *Graphical methods, *Reynolds number, Flow, Flow measurement, Energy, Mathematical studies, Flow characteristics, Hydraulic properties, Flow velocity.

Reynolds stresses have been useful in studying turbulent energy in turbulent wall flow. In the present study, they are utilized in describing measurements in the central part of a flat duct with a

1:10 aspect ration (1 by 10 sq cm). The viscous sublayer and the zone of intensive turbuent energy generation (y(+) < or = 60) in immediate proximity to the wall were examined on a specially developed water loop apparatus. Within the viscous sublayer (y(+) < 5), turbulent shear stresses account for only a few percent of the total friction, whereas at y(+) > 30, viscous friction virtually ceases to have any effect. The effects of fluctuations in u' and v' of various signs and scales on turbulent friction are examined. The role of large fluctuations in turbulent transport of momentum within the viscous sublayer is greater than in the transition layer, where the strips of ordered flow break down at a high rate, while random mixing of the liquid takes place. Results are compared with previously recorded data on the structure of the viscous sublayer. (Geiger-FRC)

SOLUTIONS OF THE COLEBROOK-WHITE FUNCTION FOR RESISTANCE TO UNIFORM TURBULENT FLOW,
University of Strathclyde, Glasgow (Scotland). Dept. of Civil Engineering.
D. I. H. Barr.
Proceedings of the Institution of Civil Engineers, Part 2: Research and Theory, Vol 71, No 2, p 529-535, June, 1981. 1 Fig, 6 Tab, 17 Ref.

Descriptors: *Mathematical studies, *Reynolds number, *Turbulent flow, *Hydraulics, *Flow velocity, Mathematical equations, Flow characteristics, Flow, Model studies, Flow friction, Resistance.

For many years, less effective approximations for the Colebrook's smooth turbulent value of the Colebrook-White function approximation for resistance to uniform turbulent flow were widely used. The determination of the diameter when the discharge or the mean velocity is given is examined. Accuracy in approximating the Colebrook-White function requires the application of a correction factor to the smooth turbulent element of the approximation. Except when programmable calculators are applied to the intermittent solution of limited numbers of problems at a time, the conventional approach of iteration to attain a chosen limit of change in value between successive solutions is a wasteful process. A single accurate approximation solution is usually preferred, not only in the simple Colebrook-White function, but in developments for its use. The function may be combined with the Poiseuille equation for continuous laminar-turbulent coverage or used with generalization components to cover transition routes other than those delineated by the simple function. NUMERICAL METHODS IN HYDRAULICS,
S. V. Voropaev, and V. M. Lyatkher.
Water Resources, Vol 8, No 3, p 225-226, May/June, 1981. Translated from Vodnye Resursy, No 3, p 32-33, May/June, 1981.

Descriptors: *Symposium, *Hydraulics, *Fluid mechanics, *Numerical analysis, Flow, Heat transfer, Mass transfer, Seepage, Waves, Flow around objects, Model studies, Mathematical models, Hydrodynamics.

The All-Union symposium on numerical methods in hydraulics was held on April 14-18, 1980, in Telavi, Georgian SSR. The symposium's main goal was to compare and analyze the results obtained on solving practical problems of hydraulics by numerical methods. Reports covered the following main subjects: flow around bodies and jet stream; free flows, waves on a water surface; flows in pressure systems; two- and three-dimensional problems of free flows; heat and mass transfer; and seepage. A trend toward the mutual concerns and merger of hydraulics and fluid mechanics was recognized. (Cassar-FRC)

Descriptors: *Turbulent flow, *Flow velocity, *Boundary layers, Eddy viscosity, Boussinesq equations, Velocity, Flow characteristics, Numerical analysis, Hydrodynamics, Mathematical models, Model studies.

The Boussinesq formula and its modifications are suitable for use under the conditions of gradual variation of the mean velocity gradient, when the time scale of the variation considerably exceeds the time scale of turbulence. However, these equations do not give satisfactory results when the velocity varies abruptly on a small time scale compared to that of turbulence. Representations which reflect the prior history of the flow are required. This paper examines a general differential equation of transport devoid of local restrictions and a simplification proposed by Hinze and Builtjes, which accounts for the memory effect. Experimental data are compared with results obtained with various equations. (Cassar-FRC)

Descriptors: *Roughness coefficient, *Channel flow, *Flow characteristics, Water level, Unsteady flow, Steady flow, Numerical analysis, Hydraulic properties, Model studies, Mathematical models, Hydrodynamics.

A numerical method for identifying hydraulic parameters (roughness coefficient, coefficient of wind stress, etc.) from data of actual measurements of the level of the free surface or depth of flow is proposed. The flow of water in a channel is described by St. Venant equations. It is assumed that the flow is gradually varied and the identification parameters are constant over the entire length of the investigated reach of the channel. Two sample problems, in which the roughness coefficient is reconstructed, are given. The necessary accuracy in determining the water level is determined by an iterative process. (Cassar-FRC)

TURBULENT TWO-DIMENSIONAL FLOW OF AN INCOMPRESSIBLE FLUID AROUND OBSTACLES WITH SEPARATION,
Central Scientific Research Inst. of Aviation Engine Construction (USSR).
L. V. Gogish, and G. Y. Stepanov.
Water Resources, Vol 8, No 3, p 267-271, May/June, 1981. 3 Fig, 4 Ref. Translated from Vodnye Resursy, No 3, p 85-90, May/June, 1981.

Descriptors: *Turbulent flow, *Flow around objects, *Flow separation, Numerical analysis, Hydrodynamics, Model studies, Mathematical models, Fluid flow, Hydraulics, Boundary layers, Flow velocity.

The integral method of calculation is the simplest and most reliable method of solving the problem of flow around obstacles with separation at high Reynolds numbers. The method uses empirical information about the general scheme of the flow, quasi-one-dimensional formulations of the problems for region of the layer and wake type, and the usual model of flow of an ideal fluid around a displacement body. Examples of calculating the velocity distribution in the case of turbulent flow around three types of objects (ledge, cylindrical segment projection, and a semicylinder, all located on a plane wall) are given. The complete solution of the problem of flow around an obstacle with separation contains five empirical coefficients. Three are concerned with the local conditions of the boundary-layer separation (increase in pressure, interaction length, and angle of deflection of the displacement body). Two characterize turbulent mixing in the near wake and in the isobaric bottom region. (Cassar-FRC)

Water Resources, Vol 8, No 3, p 304-307, May/June, 1981. 3 Fig, 5 Ref. Translated from Vodnye Resursy, No 3, p 135-138, May/June, 1981.

Descriptors: *Dam failure, *Wave propagation, Breakthrough waves, Numerical analysis, Model studies, Mathematical models, Hydraulics, Hydrodynamics, Computers.

The characteristics of the breakthrough waves formed by failure of dams and other water impounding structures were studied with a large-scale model and by numerical analysis. The test station was 1000 m long; channel width, 10-12 to 50-60 m; water volume in the upper pool, 550 cu m; and backwater height, 1.02 m. Two types of experiments were conducted: (1) instantaneous removal of the barrier and (2) blasting followed by breaks and washing away of the dam. The duration of collapse had little effect on the final results of the motion. Maximum depths of the breakthrough wave were the same; in the gradually collapsing situation maximum depths were delayed. Results of the numerical model agreed well with the observed results. Applying the numerical model to a high-head dam showed that collapse of a 100 m dam caused a breakthrough wave propagating at 30-35 m per sec, at which speed the air drag was a significant factor. Subsequently, the model was modified to account for air drag. (Cassar-FRC)

FINITE ELEMENT APPROXIMATIONS TO FLOW PROBLEMS,
Carnegie-Mellon Univ., Pittsburgh, PA. Dept. of Mathematics.
G. J. Fix.
Advances in Water Resources, Vol 5, No 1, p 17-20, March, 1982. 3 Fig, 7 Ref.

Descriptors: *Flow, *Finite element method, *Fluid flow, Fluid mechanics, Hydraulics.

Two sample problems using finite element methods to approximate fluid flows are illustrated. The first is a two-dimensional incompressible flow past an obstacle using the stream function and vorticity formulation. An appropriate variational method is developed using the classical Galerkin method. The second example is a three-dimensional incompressible flow using primative variables. The standard Galerkin method is also used, but it can only produce stable and accurate approximations with selected finite element spaces. The two necessary conditions are that the space of pressures must be related to the velocity space by a given equation and that the velocity space must satisfy a decomposition property analogous to the classical decomposition of a vector field into a curl free part and a divergence free part. Water Resources, Vol 8, No 3, p 298-303, May/June, 1981. 3 ig, 9 Ref. Translated from Vodnye Resursy, No 3, p 126-134, May/June, 1981.

Descriptors: *Channel flow, *Flow pattern, *Roughness coefficient, Reservoirs, Flood plains, Numerical analysis, flow characteristics, Flow velocity, Bottom currents, Lower Kama Reservoir, cheboksary Reservoir, *USSR, Model studies, Mathematical models, Hydrodynamics.

Practical problems in channel flow were investigated by numerical modeling using two-dimensional St. Venant equations. Graphic representations of flow in fragments of reservoirs were obtained, allowing the region of interest, such as the inlet section, to be studied without having to calculate flows for the entire reservoir. To substantiate the use of the numerical method, results were compared with results from air pressure model experiments conducted on a 49.3 km reach of the Lower Kama Reservoir. This was partitioned into three fragments. The calculated and experimentally determined velocities agreed well, but the physical experiments detected some eddy regions absent from the calculations. The effects of roughness of the flood plain and channel were investigated for fragments of the Cheboksary Reservoir. In the first study the roughness coefficient of the flood plain was 0.07 and the roughness coefficient of the channel 0-0.07. In this case the channel roughness had little effect on the result; the flows generally followed the direction of the channel. In the second series of experiments the roughness coefficient of the channel was zero and of the flood plain, 0-0.1. For a flood plain roughness coefficient $>$ 0.02 the moduli of the velocity within the channel increased negligibly with increases in roughness coefficient and decreased on the flood plain. Velocity differences were $<$ 0.02, the character of the flow changed markedly and the jet going through reached the flood plain, forming eddies of different spatial scales. (Cassar-FRC)

EXPERIMENTAL INVESTIGATION OF ACCELERATED TRANSITIONAL FLOW IN PIPES,
Tallinn Polytechnic Inst. (USSR).
U. R. Liiv.
Water Resources, Vol 8, No 3, p 307-312, May/June, 1981. 6 Fig, 5 Ref. Translated from Vodyne Resursy, No 3, p 139-145, May/June, 1981.

Descriptors: *Pipe flow, *Transition flow, *Flow characteristics, Unsteady flow, Turbulent flow, Flow velocity, Velocity, Shear stress, Accelerated flow.

The distribution of velocity and intensity of turbulence over the cross section of a flow and the corresponding shear stress values at a pipe wall were studied during the replacement of one steady flow regime by another. The experimental device used a LISA hot wire anemometric apparatus with appropriate detectors for detecting the local characteristics of unsteady turbulent flow. Considerable changes occurred in the flow structure, expresses in deformation of velocity diagrams and in a change in the distribution of the relative intensity of turbulence. Shear occurred within the relative radius of 0.66-0.79, separating the flow into two parts, core and near-wall regions. Although the new level of turbulence was mainly generated in the near-wall region, the final flow characteristics were established more slowly than in the core. The core of the flow was more sensitive to changes in a pressure gradient between ends of the pipe. Eddy stresses were noticeable in the layers between core and near-wall regions during transition flows. (Cassar-FRC)

LOCATING MONITORING WELLS,
Wright-Pierce, Topsham, ME.
B. Caswell.
Water Well Journal, Vol 36, No 5, p 42-43, May, 1982.

Descriptors: *Well hydraulics, *Monitoring, *Path of pollutants, Seepage, Groundwater movement, Vertical flow, Flow velocity, Stratigraphy, Plumes, Geohydrology.

Monitoring wells are used to measure groundwater potentials and obtain water samples for chemical analysis. The hydrogeological factors involved in location of long-term monitoring wells are discussed. Monitoring wells must be located so that they intercept groundwater flowing either into or away from a contaminant source. Long well screens obtain integrated samples, and short screens obtain samples from a specific layer. It may be sufficient to estimate horizontal flow at the site by observation of local topography, but more detailed informaton from observation wells or seismic refraction data may be needed in some cases. Stratigraphy is important. Wells in sand are easy to locate, but wells in granite must be located in specific fractures. Clay layers may interfere with transmission of contaminants; the well screen must be placed in the layer to be monitored. Knowledge of vertical flow patterns is important because contaminants may be moved beneath a too-shallow well in a recharge area, or a too-deep well in a discharge area may intercept only upward moving uncontaminated water. Seepage velocity is important in determining the desirable distance between source and monitoring wells. Dispersion and the geometry of the slug or plume of contamination must also be considered in selecting number location of wells. The density of the contaminant will determine whether the substance will migrate downward and across normal groundwater flow lines. Existing aquifer stresses can alter flow directions and seepage velocities. (Cassar-FRC)

HYDRAULIC ANALYSIS, PAINT CREEK AT STATE ROUTE 772, CHILLICOTHE, OHIO,
Geological Survey, Columbus, OH. Water Resources Div.
R. I. Mayo, and W. P. Bartlett, Jr.
Open-File Report 81-350, 1981. 13 p, 17 Feg, 1 Tab, 4 Ref.

Descriptors: *Bridge design, *Hydraulics, *Flood profiles, *Flood flow, Flood recurrence interval, Flood frequency, Flood discharge, Hydrologic data, *Ohio, Chillicothe, Paint Creek.

The Ohio Department of Transportation, Division of Highways, proposes to replace a three-span arch bridge across Paint Creek on South Paint Stree in Chillicothe, Ohio with a new deck-type structure resting on four sets of piles and four piers. Profiles of the 10-, 25-, 50-, and 100-year floods under present conditions and under conditions modified by construction of the new bridge are presented in this report. The results indicate that the construction of the new bridge will not cause significant changes in the flood profiles or the areas inundated. (USGS)

SUPERCRITICAL FLOW FLUMES FOR MEASURING SEDIMENT-LADEN FLOW,
Science and Education Administration, Fort Collins, CO.
R. E. Smith, D. L. Chery, Jr., K. G. Renard, and W. R. Gwinn.
Technical Bulletin No 1655, July, 1982. 70 p, 43 Fig, 3 Tab, 12 Ref, 4 Append.

Descriptors: *Flumes, *Sediment load, *Discharge measurement, Open channel, Flow discharge, Rapid flow, Velocity, Sediment transport, Supercritical flow flume.

High natural velocities and sediment concentrations in many locations prohibit the use of ordinary subcritical flow flumes because these flumes require such low approach velocities that sediment is deposited. Supercritical flumes have been developed to provide flow measurement for conditions of heavy sediment where ordinary flumes do not perform satisfactorily. A general type of supercritical flow flume, called the Walnut Gulch flume, has been developed over many years of experience and testing in discharge measurements at the Walnut Gulch experimental watershed, Tombstone, Arizona. Methods have been developed to analyze flows that exhibit lateral asymmetry in cross sectional profile, and porous dikes have been developed to considerably reduce asymmetry in the alluvial approach section to these flumes. The experience with the Walnut Gulch flumes has led to an improved design of supercritical flume, called the Santa Rita flume. The flume was intended for use in small channel flow measurement, generally less than 4 cu m/s. The slope of the floor breaks at the entrance to the curved approach, and the curvature of the approach wall has been reduced somewhat to decrease the tendency of waves to develop in the throat when flow direction changes too rapidly. LABORATORY INVESTIGATION OF DEFORMATIONS OF CANALS IN SAND,
Akademiya Nauk SSSR, Moscow. Inst. Vodnykh Problem.
L. I. Vikulova, O. N. Shishova, and E. A. Selivanova.
Water Resources, Vol 8, No 4, p 389-397, July/August, 1981. 6 Fig, 4 Tab, 9 Ref. Translated from Vodnye Resursy, No 4, p 91-102, July/August, 1981.

Descriptors: *Sediment transport, *Canals, *Sand, *Canal embankments, Deformation, Channel erosion, Channel morphology, Erosion, Unstable channels, Bank erosion, Open-channel flow, Channel flow, Flow velocity, Rivers, Dunes, Shoals, Flumes.

Deformation of canals in sand was studied in a 20 x 4 x 1 m flume formed from sand. Several conclusions were reached. Transverse transport of sediment along troughs of underwater sand dunes is an important factor in the channel formation process. The transport of sediment from the banks along the troughs of oblique dunes causes slope instability, eventually widening the channel. Transverse sediment transport within the channel distributes suspended sediment over the entire width of the channel and promotes formation of large bed forms. The two stages of channel development are (1) initial (the channel widens, shoals, loses capacity, and develops transverse dunes, which cause bowing of the flow), and (2) transition (formation of large bed formations as are seen in rivers). The third stage could not be modeled in the laboratory because vegetation is a major factor. The formation of shoals and secondary dunes occurs at constant water discharge. The rate of widening of the channel is dependent on current velocity. (Cassar-FRC)

A description is offered of a case of resonant waterhammer on a 270 MW, 550 m gross head project in Colombia. Pressure fluctuation measurements are included and the remedial measures taken to safeguard the installations. The water supply system consists of a 160 meter long tunnel and two penstocks. The total length of the pipes is quite small to cover the height difference between the valve house and the powerplant. Two butterfly valves are provided to control the flow, one at the upstream end of each of the penstocks and six spherical ones at the downstream end, just before the entrance to the scroll case of each of the turbines. The first stage of the project came into operation in 1962. and the second stage in 1965/66. Resonance has occurred on two occasions. After

the phenomenon was studied, it was concluded that typical self-excited resonance had taken place, and that the only element which could have caused the problem was the spherical valve. After a while the conditions for penstock-valve vibration and pressure oscillation of the hydraulic system were tracked down, and the phenomenon could be reproduced at will. Resonance occurred on penstock 1 if the needle valves of units 1 and 2 were open, and a complete shutdown of the system was carried out independently of which one of the units 1 to 6 was taken out of operation. Resonance occurred during a complete outage, though with lower intensity if the needle valves of either 1 or 2 were open. Resonance was noted in penstock 1 and the spherical valve of the unit of which the needle valves were open. No resonance occurred if units 3 to 6 were in operation and units 1 and 2 were stopped, regardless of whether the needle valves of these units were left open or not. (Baker-FRC)

SIMULATING AND IMPROVING HYDRO PLANT CONTROL,
Bochum Univ. (Germany, F.R.). Dept. of Mechanical Engineering.
K. H. Fasol, and M. Hoppe.
International Water Power and Dam Construction, Vol 34, No 5, p 73-78, May, 1982. 6 Fig, 13 Ref.

Descriptors: *Hydroelectric plants, *Control systems, *Simulation analysis, Turbines, Computers, Model studies, Flow regulation.

Analog simulation of a small hydro station with two 40 MW Francis turbines was carried out to provide information on the dynamic performance of the plant. As a result as additional stabilizing compensating circuit was designed, tested by simulation, and then tested in a prototype version. Field tests of frequency response and isolatd network operations confirmed the reliabiity of the simulation. The problem facing this station was the lack of a surge tank within the 6 km long water supply tunnel. Only very small rates of change in the guidevane opening were permitted before instability was reached. (Cassar-FRC)

AERATION AT FLOOR OFFSETS IN BOTTOM OUTLETS (BELUFTUNG AN SOHLSPRUNGEN VON GRUNDABLASSEN),
Technische Hochschule, Aachen (Germany, F. R.). Inst. fuer Wasserbau und Wasserwirtschaft.
M. Horster, S. Rabben, and G. Rouve.
Wasserwirtschaft, Vol 72, No 3, p 157-159, 1982. 6 Fig, 3 Ref. English Summary.

Descriptors: *Aeration, *Bottom outlets, *Dams, *High-velocity jets, Floor offsets, Cavitation, Velocity, Energy transfer, Reservoirs, *Gates, *Tunnels, Design criteria, Water pressure, Hydraulic engineering.

Bottom outlet tunnels usually have a very large cross-section due to a small energy gradient drop during operation. The main gate can be placed either at the beginning of the outlet or in the middle of the tunnel. In both cases the gate is the critical transition from pressure to nonpressure flow, where potential energy is transformed into kinetic energy and the question of adequate aeration from above arises. This question can be avoided by placing the gate at the end of the tunnel. The tunnel floor should then be curved in the direction of flow and should be furnished with a connecting offset. In this way, high velocity jets discharging below the gate can be aerated from below as well as naturally from above. Cavitation is also prevented because in the area of the concave curve, pressure forces arise that exceed by far the static pressure. (Gish-FRC).

DESIGN OF HEAT PUMP RETURN WELLS,
Michigan Dept. of Public Health, Lansing.
D. K. Keech.
Water Well Journal, Vol 36, No 6, p 32-33, June, 1982. 1 Fig, 1 Tab.

Descriptors: *Wells, *Design criteria, *Heat pumps, Return wells, Groundwater recharge, Artificial recharge, Recharge, Induced infiltration.

A return well for groundwater heat pumps must be isolated from possible sources of pollution as required by various state or local codes. Construction of the return well should be equal in materials and workmanship to that of a production well and also meet all construction code requirements for the area. In Michigan a clamp-on type of pitless adapter is generally used as the frostproof casing connection to the well. Pressurization of gaskets is a requirement for approval of this design and is important from a public health standpoint on either a production or a return well. Pressurization of the discharge line also has a practical value in preventing water from draining from the drop pipe. It is recommended that 10 psi of pressure be maintained on the line between the heat pump and return well. The back pressure valve must be calibrated to meet the head pressures caused by the static water level for each individual return well. The water level in a return well is elevated in order to apply the higher head that is needed to transmit the water into the aquifer. The specific capacity should be compared to the proposed rate of discharge into the return well. A return well with a specific capacity greater than 1 gpm/ft of drawdown will generally indicate a usable return well, providing the static water level is at a depth of 20 to 25 feet below ground level. One modification which may improve a marginal return well or aid wells with a higher static head is the use of a drawdown seal. (Baker-FRC)

DESIGN CONSIDERATIONS IN WATERWORKS PUMPS SELECTION,
McGraw-Edison Co., N.Y.
W. C. Krutzsch.
In: Water/Engineering and Management, Reference Handbook-1982, p 40-43, May, 1982. 3 Fig, 4 Tab.

Descriptors: *Water treatment facilities, *Pumps, Design criteria, Wastewater facilities, Cavitation.

To ensure the selection of pumps which will provide maximum efficiency, it is necessary to consider specific speed. It has been estblished that the most efficient pumps are those having specific speeds falling in a range of about 2,000 to 2,500. Values below 1,500 are seldom acceptable for networks applications except where the pumps are small and power requirements low. For any given combination of capacity and head, specific speed is directly proportional to pump speed, and higher values of the former can be achieved only by increasing the latter. This situation is unacceptable because the net positive suction head required (NPSHR) of the pump at higher speeds cannot be provided by the system. Pump performance will be unsatisfactory due to cavitation, with resulting noise, vibration, and possibly serious damage to the impeller and to other pump components as well. Recirculation will develop independently at the impeller inlet and outlet as capacity is reduced, most frequently at different capacities for each of these regions. Its cause is inherent in the nature of the centrifugal pump and the uses to which it is put. High specific speed pumps are less suited to waterworks services than optimum specific speed designs. They are most susceptible to recirculation and tend to have more limited operating ranges. The beneficial effects of increased NPSHR on the operating range of a pump can only be realized if the pump manufacturer can take advantage of it. While economic advantages of high specific speed pumps are often publicized, their disadvantages must be noted, and may not become apparent until after installation, making it a costly process. VARIABLE FREQUENCY DRIVES - SOME APPLICATION PRINCIPLES,
Robicon Corporation, Pittsburgh, PA.
R. N. Hamilton.
In: Water/Engineering and Management, Reference Handbook-1982, p 55-56, 58-60, May, 1982. 5 Fig.

Descriptors: *Water treatment facilities, *Design criteria, Energy conservation, Wastewater treatment, Pumps, Hydraulic engineering, Hydraulic design, Hydraulic equipment.

A review of one of the major energy saving potentials typical of the water treatment industry is offered. Use of a variable speed drive can accomplish reduced flow conditions by slowing down the speed of the pump impeller, allowing the motor pump combination to deliver the lower flow at a lower head. With many centrifugal pumps, this means of reduction will require horsepower input proportional to the speed cubed. It is the substitution of variable speed of the prime mover for throttling or bypass of a portion of the pumped fluid to accomplish flow modulation that is the basic idea and will bring about energy savings to the industry. If a system will operate with a control valve to maintain flow at 80% or less for 25% of its operating time, the economies of a variable speed drive for centrifugal machinery should be investigated. If a system is operating with a variable speed drive at 80% flow or less for 50% of its operating time, substitution of a more efficient solid state drive should be investigated. Employment of a variable frequency drive will provide a secondary benefit for the starting of the motor. By using a variable-frequency drive to start the motor, breakdown torque as a limit is available on starting rather than locked-rotor and pull-up torque. This will prove useful to hydraulic engineers confronted with severe limitations of a power system. Other applications include high pressure fans, blowers or compressors used to introduce air to increase oxygen content. (Baker-FRC)

PUMP SUMP DESIGN EXPERIENCE: SUMMARY,
Engineering Hydraulics, Inc., Longmont, CO.
C. E. Sweeney, R. A. Elder, and D. Hay.
Journal of the Hydraulics Division, Proceedings of the American Society of Civil Engineers, Vol 108, No HY3, p 361-377, March, 1982. 8 Fig, 2 Tab, 16 Ref.

Descriptors: *Design criteria, *Sumps, *Pumps, Hydraulic models, Performance evaluation, Flow characteristics, Hydraulic machinery, Cooling water, Vibration, Model studies.

The capacity of vertical mixed flow pumps used to provide cooling water for industrial purposes and power generation has been increasing in recent years. However, since the thickness of the casing wall and the rigidity of the support do not increase in the same proportion as the hydrodynamic loading on the pump, larger pumps are more susceptible to vibration and rough running and better entrance flow conditions are needed to ensure satisfactory performance. The conditions of flow entering a pump are the net result of approach flow to, and the hydraulic design of, the sump in which the pump is operated. Hydraulic conditions which may result in pump performance problems, standards currently used in sump design, and criteria used to judge the acceptability of sump designs on the basis of the performance of hydraulic models are discussed. The designs of seven wet well sumps

LIBRARY U. OF I.. URBANA-CHAMPAIGN

for vertical mixed flow pumps modified through hydraulic mode tests are presented and compared with design standards currently in use. Although currently published standards for basic sump dimensions provide a good starting point, modifications are needed to achieve satisfactory hydraulic performance by large pumps. Performance criteria used in the development of the existing standards may not have been as stringent as those required for current large capacity pumps. A variety of suggestions for sump modifications and dimensions are presented which may provide a basis for developing conceptual or trial designs for sumps for large capacity pumps. A hydraulic model study should be performed when designing any major pumping facility to assure satisfactory performance. (Carroll-FRC)

SWIFT ACTION BY STATE OFFICIALS PREPARES FOR WATER SUPPLY CRISIS.
Public Works, Vol 113, No 3, p 64-65, March, 1982.

Descriptors: *Water transfer, *Water supply, *Pumping plants, New York, New Jersey, Drought, Pipelines, Water shortage.

New Jersey installed a 20 mgd temporary, portable 24 inch water main across the George Washington Bridge, to supply water to the drought-stricken northeast section of the state in 1981. The source of the water was the upper Delaware River, from which New Jersey had not previously used its full allotment. A permanent pumping station was built in an unused tunnel at 179th and Amsterdam Avenue, New York. Suitable pumps, which normally require months to fabricate, were diverted from shipment to a petroleum company in the Southwest. The pump and pipeline system is available for use in water emergencies and can be dismantled and stored in years of adequate rainfall. (Cassar-FRC)

ZIMBABWEAN HAND PUMP PASSES VILLAGE-LEVEL ENDURANCE TESTS.
Water Water, Vol 5, No 5, p 36-37, May, 1982.

Descriptors: *Pumps, *Developing countries, Rural areas, Wells, Water supply, *Zimbabwe.

The low cost, rugged Blair/Prodorite hand water pump, developed in Zimbabwe, appears to fulfill the criteria for a village level operation and maintenance pump. Costing $75 in kit form, the pump is made of lightweight plastic. Only the galvanized iron pump handle, which doubles as the water spout, is visible above ground. Below ground the pump consists of two plastic cylinders, one inside the other, fitted with identical valves at the base. The inner pipe is the piston/push rod. The upstroke draws water into the cylinder through the lower fixed foot valve. The downstroke closes the foot valve and forces water up the hollow portion to the surface. The pump is usable to depths up to 15 m. It lifts 20 liters per min, and 30-40 strokes by a young person can fill a bucket. Installation requires only the simplest tools and little technical expertise. Maintenance is confined to occasional clearing of debris from the foot value. In a factory test the pump was continuously pumped for 6 million strokes (90 years of use for a single family) with no detectable wear. (Cassar-FRC)

FLOW CONTROL AT STORMWATER OVERFLOWS AND STORMWATER TANKS (ABFLUSSSTEUERUNG VON REGENWASSERBEHANDLUNGSANLAGEN),
H. Brombach.
Wasserwirtschaft, Vol 72, No 2, p 44-52, February, 1982. 6 Fig, 1 Tab, 17 Ref. English Summary.

Descriptors: *Control systems, *Storm-overflow sewers, *Storm wastewater, *Hydraulic equipment, Wastewater facilities, Wastewater treatment, Valves, Flow control, Flow characteristics, Hydraulic engineering, Decision making, Planning, West Germany.

Various controllers for stormwater treatment plants are discussed in terms of performance and suitability for different types of facility. Pipe throttles are the most common type of controller in the West German sewage system, though they are not easily adapted to differences in quality and quantity of flow. The throttle slide valve is suitable for stormwater overflows and purification basins due to its low height and space requirements, large discharge, and subquadratic discharge pattern. Vortex throttles can significantly undercut the minimum discharge of the pipe throttle and are especially useful for small stormwater basins. The automatic vortex valve has roughly the same discharge span as the vortex throttle but is safer during operation; it is suited to storm overflow basins because it switches on less often and later than other controllers and produces its own short flushing surges. The float flap with nonlinear kinematics is well suited to stormwater overflow basins and flood protection basins, while the closed-loop controller (a hybrid using both electromechanical and hydraulic energy) is employed exclusively in exposed stormwater basins. The stop-and-go controller is used for stormwater basins with outflow of < 10 l/sec, because continuous control provides too small a sweeping force and too great a risk of blockage. A complex diagram to aid in the choice of a controller is presented, as is a method for installing a cortex valve. A five-step plan for controller strategy for a serial system of overflow basins is described. Transition to automatic systems is presented in the form of a three-stage plan. (Gish-FRC)

THE VALUE OF INSPECTION GALLERIES,
Lahmeyer International G.m.b.H., Frankfurt am main (Germany, F. R.).
C. Kutzner.
International Water Power and Dam Construction, Vol 34, No 5, p 78-84, May, 1982. 5 Fig, 1 Tab, 18 Ref.

Descriptors: *Inspection galleries, *Dam design, *Seepage control, Earth dams, Rockfill dams, Grouting, Drainage systems, Dam foundations, Foundation rocks.

Inspection galleries, also known as grouting galleries, inspection tunnels, drainage galleries, or control galleries, are often built inside or below dams. This paper discusses the advantages of inspection galleries in earth and rockfill dams. Seepage monitoring and control can be readily accomplished by piezometers installed in the inspection gallery. Release holes for preventing or reducing uplift below the downstream dam body can be readily drilled from the gallery. Underground settlement and displacements can be monitored from the gallery. Grouting work can be performed from the gallery without disturbing the embankment filling process. If necessary, grouting can also be done after impoundment. The negative aspects of galleries include extra costs and the possibility of disturbing foundation rock. Design and construction details for inspection galleries are given. (Cassar-FRC)

THE GROSSE DHUNN DAM AND THE FACILITIES FOR THE CONTROL OF STABILITY AND FUNCTIONING (DIE GROSSE DHUNNTALSPERRE UND DIE MESSEINRICHTUNGEN ZUR UBERWACHUNG DER STANDSICHERHEIT UND DER FUNKTIONSTUCHTIGKEIT DES DAMMES),
Talsperrenabteilung des Wupperverbandes (Germany, F. R.).
F. Cords.
Wasserwirtschaft, Vol 72, No 3, p 119-123, 1982. 9 Fig, 1 Tab, 2 Ref. English Summary.

Descriptors: *Dams, *Measuring instruments, *Rockfill dams, *Dam construction, Hydraulic engineering, Drinking water, Reservoirs, Water resources development, Water supply, Soil mechanics, Seepage, Safety, *West Germany, Grosse Dhunn Dam.

The Wupperverband constructed the Grosse Dhunn Dam 10 km east of Leverkusen, West Germany, to ensure an adequate drinking water supply for the Bergisches Land to the year 2000 and beyond. This is a rockfill dam (built 1979-1980) with bituminous core sealing and a grout curtain (finished in 1981) with double rows to 25 m and single row to 50 m under foundation level. The dam is 63 m high, 380 m long, and 8.5 m wide. Its capacity is 81 cu hm. The planning, subsurface exploration, construction, and installation of measurement and control equipment is described. The rockfill-type dam was chosen as esthetically pleasing in the given landscape. Soil mechanics studies resulted in the bituminous core being bent toward the air side in the upper third and in the division of the dam cross-section into core zones with fill of small rocks and outer zones where less sealing was required. Particular care was taken to perform quality control on the bituminous core, as after installation this can no longer be inspected. Numerous measurement points were installed to observe all movement and sealing properties of the dam during and after construction. External deformations could be detected by above-ground measurement points at five dam cross-sections, while internal deformations could be measured on the air side by a shaft lying along the third above-ground cross-section. Techniques applied were leveling, angle measurement, electrooptical distance measurement and optical sounding in the shaft. Tension measurement was also performed. To control the sealing properties, the transition zone on the air side of the bituminous core was constructed of coarse ballast without fill to allow for seepage. (Gish-FRC)

TEST AND CONTROL PROGRAMME FOR TWISTE DAM SITUATED IN SANDSTONE AND WITH RESTRICTED EXTENT OF SUBSURFACE SEALING (MESS- UND UBERWACHUNGSPROGRAMM EINER STAUANLAGE IM BUNTSANDSTEIN BEI BEGRENZTER UNTERGRUNDABDICHTUNG AM BEISPIEL DER TWISTETALSPERRE),
G. Bjornsen.
Wasserwirtschaft, Vol 72, No 3, p 135-139, February, 1982. 6 Fig, 4 Ref. English Summary.

Descriptors: *Dam design, Geology, *Sandstones, *Soil mechanics, *Rockfill dams, *Groundwater movement, *Sealing, Safety, Design criteria, Dam construction, Dams, Hydraulic engineering, Twiste Dam, *West Germany, Seepage, Permeability, Drainage, Testing procedures.

Geological conditions at the site of the Twiste Dam, West Germany, are unfavorable. The dam is situated in new red sandstone, and the valley gravel and sides and the underlying rock are permeable. Groundwater streams are forced to change direction around the dam shoulders and into a neighboring valley. The dam itself is permeable, as it is filled with new red sandstone, but water pressure is reduced by the carpet of river clay on the valley floor and by weathered rock on its sides. Soil mechanics and projections of groundwater flow under and around the dam by means of potential theory determined the dam design. The fill was compressed in layers to reduce permeability, and a trench-furrows drainage system was built on the air side embankment to lessen possible negative effects of compression on the surface filter. Because of the soft plastic clay foundation, the dam was built very wide with a flat embankment; to improve the watertightness of the clay, additional clay sealing and compression of the basin floor were performed. Reduction of water flow around the dam was achieved by extension of the injection curtain about 20 m beyond the shoulder. A five-year test program, during which the dam was filled to capacity in stages, confirmed the theoretical model and led to the introduction of additional

safety measures. For example, meadows below the dam became waterlogged and a drainage system was constructed; seepage into the neighboring valley necessitated an extension of the valley-side sealing to the height of greatest operating capacity. The program demonstrated the importance of separate geohydraulic systems: on the one hand, bank prefilling, valley-side permeability and trench-furrowed drains; on the other, basin sealing, rock foundation, dam, and surface drains. The influence of anisotropy should be taken into account at the planning stage. (Gish-FRC)

8E. Rock Mechanics and Geology

INVESTIGATIONS FOR NORWAY'S LONGEST UNLINED PRESSURE SHAFT,
Geoteam A/S, Oslo (Norway).
J. Bergh-Christensen, and R. Kjelberg.
International Water Power and Dam Construction, Vol 34, No 4, p 31-35, April, 1982. 9 Fig, 2 Tab, 3 Ref.

Descriptors: *Excavation, Water resources development, *Norway, Construction, Stability, Mathematical studies, Computers, Model studies, Design criteria, Geological surveys, Tunnels.

An unlined pressure shaft is described which will sustain the highest water pressure in Norway, and probably in the world. The geology of the site is described, along with studies undertaken to determine the design criteria. The pressure shaft is 1130 meters long, with a static head of about 1000 m. The topography of the sites is complex, and the main part of the scheme is at an evaluation varying between 1000 and 1200 meters, where the terrain is mountainous and rugged. From the reservoir the water is fed through a headrace tunnel to the top of the pressure shaft at an altitude of 800 meters. The pressure shaft itself will have an inclination of 45 degrees, with its lower end just inside the powerplant. The method used for evaluation of the shaft siting is based on a calculation of total stresses by finite element plain strain analysis. The main condition imposed by this approach is that the minimum total stress should be higher than the water pressure at every point along the shaft, to avoid the risk of failure by hydraulic fracturing. The computer program used gives, for this type of finite-element analysis, the stress distribution along a vertical plane normal to the contour lines of the terrain model. The shaft has to be located, in this case, obliquely in relation to the valley side, and consequently the standard program does not give the complete stress distribution along the shaft in a single run. The results of the model studies indicated that the maximum total stress was mainly parallel to the valley side. The preliminary location of the shaft should be sufficiently safe, from these studies, and this location was chosen for the final site. (Baker-FRC)

DESIGNING AND EXCAVATING UNDERGROUND POWERPLANTS,
Trondheim Univ. (Norway). Dept. of Geology.
E. Broch.
International Water Power and Dam Construction, Vol 34, No 4, p 19-25, April, 1982. 8 Fig, 8 Ref.

Descriptors: *Powerplants, *Design criteria, Construction, Tunnels, *Underground structures, Stability analysis, *Norway, Geologic fractures, Geology.

Norwegian experience in the field of underground powerhouses is reported, noting that about half the world's underground stations are located in that country. Until recently the conventional drill and blast technique has been the dominating method of excavation. Approximately two thirds of the country consists of Precambrian rocks, with different types of gneisses dominating. Other major rock types from this era include granites, gebbros and quartzites. There are also provinces dominated by arkosic sandstones and shales. Norwegian bedrock is very old and, from an engineering geological point of view, one could describe it as a typical hard-rock province. With knowledge of geological conditions, a geological engineer may give advice so that construction problems for an underground opening in rock may be avoided or solved in an economical way. Geological conditions include the types of rocks and the mechanical properties of each, the jointing of the rock masses, the weakness zones of the bedrock, stress conditions in the rock masses and the water conditions in the rock masses. The most important part of a feasibility study for an underground opening is to find the right place and position. Certain unfavorable types of rock should be avoided. Soapstones, serpentinites and periodotites together with jointed tectonites with clay coated joints and fissures have caused severe stability problems in underground openings. Considerations for the orientation of the long axis of the powerhouse, shaping of underground openings, dimensioning of underground openings, and design considerations for unlined shafts and tunnels are discussed. (Baker-FRC)

THE ANNABRUCKE RIVER POWER STATION ON THE DRAU, CONSTRUCTIONS TAKEN TO PREVENT EROSION IN THE VICINITY OF THE BARRAGE ON AN EXCEPTIONAL SUBSOIL (DAS DRAUKRAFTWERK ANNABRUCKE, MASSNAHMEN ZUR VERHINDERUNG DER EROSION IN BEREICH DES BAUWERKES AUF AUSSERGEWOHNLICHEM UNTERGRUND),
H. Breth.
Wasserwirtschaft, Vol 72, No 3, p 152-157, 1982. 15 Fig. English Summary.

Descriptors: *Powerplants, *Weirs, *Subsoil, *Erosion, Hydroelectric plants, Erosion control, Geologic mapping, Geologic formations, Sealants, Silt, Dams, Water resources development, Filters, Screens, Drau River, *Austria, Control systems, Seepage control, Design criteria, Hydraulic engineering.

The power station Annabrucke and the accompanying weir were constructed on the River Drau in Austria on a subsoil endangered by erosion. The subsoil is composed of very permeable river gravel under which a layer of semi-permeable silt of varying thickness is found; within the latter, sands and occasional pockets of gravel occur caused by the steep angle of these strata. Under the main barrage and turbine and weir outlets lies the largest pocket of gravel containing dangerous inlays of uniform-sized grains. In order to use the silt layer as a sealing element, the power station and weir, as well as the two dams adjoining them on either side were joined to the silt layer by a sealing screen. The braking effect of the silt meant that seepage water would flow through the three-level surface filter behind the main structure into the bottom water almost without pressure. A further louvered slide was built behind the surface filter to cut of the uniform grain layers and force groundwater through the filter. An electrical analogy model confirmed the sealing and braking concept. The decision to build a power-station complex on such a foundation requires extensive site investigation using numerous bores to construct a model as well as a thorough observation system so that runoff can be controlled not only under the main structure but also under the basin and dams bordering the basin, behind the dams and in the bottom water under the main structure. A year after operation began, measurements showed that the braking effect of the silt and the draining effect of the uniform-grain layers ensured that seepage was dissipated before it reached the turbine and weir outlets so that the danger of erosion in the susceptible layers was eliminated. (Gish-FRC)

INVESTIGATION OF THE PARAMETERS OF WAVES ON A RESERVOIR SURFACE IN THE EPICENTRAL ZONE OF AN EARTHQUAKE,
Akademiya Nauk URSR, Kiev. Inst. of Hydromechanics.
B. N. Ostroverkh.
Water Resources, Vol 8, No 3, p 282-288, May/June, 1981. 4 Fig, 4 Ref. Translated for Vodnye Resursy, No 3, p 105-113, May/June, 1981.

Descriptors: *Reserviours, *Earthquakes, *Wave propagation, *Oscillatory waves, Mthematical models, Seismic waves, Model studies, Numerical analysis, Wave height, Rock mechanics.

The effect of earth quake zone parameters on surface waves in reservoirs was investigated using a numerical model to vary depth of the zone, rate of dislocation diffusion, remoteness from the epicenter, and the direction of tangent stresses along the displacement walls of the fissure. Figures showed the value of the maximum displacement of the water (the wave height) as a finction of: (1) the distance of the earthquake focus and (2) the depth of focus. Modeling results indicated that consideration of the combined oscillations of the elastic region and fluid region had a negligible effect on the oscillations of the elastic region, i.e., the oscillations of the surface of the wet and dry bottom were not significantly different from one another. However, it was necessary to consider the residual deformations of the bottom, formed in the case of a shallow-focus earthquake.(Cassar-FRC)

8F. Concrete

WORLD'S FIRST ALL-ROLLCRETE DAM,
Army Engineer District, Walla Walla, WA. North Pacific Div.
E. K. Schrader.
Civil Engineering (New York), Vol 52, No 4, p 45-48, April, 1982. 2 Fig.

Descriptors: *Dams, *Construction materials, Construction, Design criteria, Water resources development, Water supply, *Concrete, Oregon.

The use of roller-compacted concrete was explored in the construction of a 400,000 cubic yard of concrete by more than two-thirds. Willow Creek Dam will be the world's first gravity dam to be built entirely with roller compacted concrete. Other such dams are now under construction. By using this method, Willow Creek Dam will be built with 75% less material than was required for the originally designed rockfill structure. The dam will be built in about one year instead of the three years previously planned. The spectacular savings in both time and money are due to the lower cement content required and the substitution of efficient earthmoving equipment and techniques for the far more labor intensive bucket-by-bucket procedure for placing conventional concrete. One of the main advantages of the design at Willow Creek was the elimination of a separate side channel spillway otherwise required for a rockfil or embankment dam. (Baker-FRC)

MIX DESIGN PARAMETERS FOR CONCRETE CONTAINING CHEMICAL ADMIXTURES,
E. L. Ore.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-237082. Price codes: A03 in paper copy, A01 in microfiche. Bureau of Reclamation Report REC-ERC-81-6, December 1981. 27 p, 12 Fig, 5 Tab. 0-07-DV-00109.

Descriptors: *Concrete additives, *Concrete technology, *Concrete mixes, Compressive strength, Cements, Temperature effects, Aging, Setting time, Water-cement ratio.

Concrete samples having water to cement ratios ranging from 0.35 to 0.65 with various quantities of WRA (water-reducing and set-controlling admixtures) ranging from 0.00 to 0.40% at three temperatures were prepared and periodically tested at intervals up to 1 year. An average quality aggregate was used to provide adequately conservative concrete design data. The effect was evaluated for each condition of WRA on the rate of hardening at early ages, as shown by the resistance to penetrate of the wet-screened mortar, and at extended aging, as shown by the compressive strength. The larger dosages of WRA generally resulted in lower water requirements; however concrete with 0.10% WRA required slightly more water than the reference

LIBRARY U. OF I., URBANA-CHAMPAIGN

concrete. From 21 to 32 C, the water requirement increased 4.5% for each 5.5 degree temperature change. The setting time of mortar, wet-screened from concrete, increased as the WRA dosage increased. Larger amounts of WRA resulted in 1-day compressive strengths which were lower than the reference concrete, but by 3 days all concrete samples with WRA were stronger than the reference concrete. All concretes containing WRA were stronger than those without WRA except for the 0.40% WRA concrete where the 1-day strengths were slightly less. The use of WRA's was most effective in concrete with lower water-cement ratios and higher temperatures. A comparison of concretes with equal 28-day strengths but different water-cement ratios showed that the concrete without WRA was stronger at 90 days and 1 year than that with WRA. (Moore-SRC)

WATER TANKS IN REINFORCED CONCRETE,
Norwest Holst Construction Ltd., Watford (Englandd).
W. M. Pedder.
Water Services, Vol 86, No 1033, p 117-119, March, 1982. 2 Fig, 1 Tab.

Descriptors: *Concrete construction, *Water tanks, Reinforced concrete, Water storage, Design criteria, Joints.

Reinforced concrete water storage tanks are commonly constructed in pairs, buried and landscaped for esthetic reasons. A typical design is 2 tanks each 25 m square, 4.5 m deep. Each tank roof is covered with gravel for grainage and soil for a grass cover. Expansion joints are not usually required up to about 70 m length. Columns to support the roof are conveniently spaced on a 4.8 m square grid. All vertical wall joints, except corners, and internal movement joints should be full contraction joints. Roof joints are partial contraction joints. Metal or polyvinyl chloride water bars and sealant are usually provided at all joints. Details for design of walls and roof slabs are given. (Cassar-FRC)

SECURITY ASPECTS AT THE DESIGN AND CONSTRUCTION OF SEALING FOR DAMS (SICHERHEITSASPEKTE BEI KONSTRUKTION UND AUSFUHRUNG VON DAMMIDICHTUNGEN),
By H. Steffen.
Wasserwirtschaft, Vol 72, No 3, p 144-147, 1982. 3 Fig, 3 Ref. English Summary.

Descriptors: *Sealants, *Dams, *Errors, *Design criteria, Core seals, Surface seals, Materials, Hydraulic engineering, Stress, Seepage, Erosion, Construction, Stress, Construction joints, Expansion.

The installation of sealing in dams is discussed with emphasis on the interaction between the sealing and transition materials, foundation and support structures. For surface sealing, the foundation should be laid so that as little movement as possible occurs through consolidation, or transition materials should be chosen that allow the sealing to move in the direction of the expected stress. Copper is preferable to plastic where the transition material must carry high water pressure. Common errors are failure to place an expansion joint in the area where movement is expected or a too-massive construction of the transition joint. Plastic materials are more susceptible to erosion. Core sealing may experience fission forces if distortions occur in the supporting structure; these may lead to seepage and erosion. Distortion of the core is another cause of damage. For asphalt cores, transition zones are recommended. Quality control of the sealing during and after installation is important: for core sealing, an area may be singled out as a test zone, and test cores should be extracted from the main core; the success of surface sealing can be determined by isotope sounding. Four examples of sealing errors are given: a too-porous material was used in the first-ever bituminous core seal, and led to permeability; in an asphalt membrane seal a tear above the joint led to slippage of the shear stress of the seal away from the joint, which caused a tear; a too-large joint in an asphalt seal caused a lack of give with expansion stress and let to the seal separating from the dam; and a tear occurred between strips of plastic sealing, allowing water to flow into the dam. None of these failures presented a danger to dam security, due to well-planned design and inspection measures. (Gish-FRC)

SEWERAGE: PRIORITIES FOR ACTION,
Water Research Center (England).
D. Fiddes, and M. J. Rouse.
Water Pollution Control, Vol 81, No 2, p 280-287, 1982. 12 Ref.

Descriptors: *Sewer systems, *Rehabilitation, Maintenance, Structural engineering, Physical properties, Construction materials, Hydraulic profiles.

This paper considers both the structural and hydraulic problems involved in planning proper sewage transport and treatment and suggests priorities for action by the industry. Evidence for the scale of sewer dereliction in the United Kingdom is collected from two sources: collapse and sample surveys. Data collection has been a major problem, as historic data were scarce. A collapse is defined as any sewer failure where excavation is required to effect the repair. The UK collapse rate appears to be about 5000 incidents per year. The current collapse rate would suggest a mean service life for the current sewer population of about 1000 years. Evidence from closed circuit television surveys shows that after reaching about 70 years of age, brick sewers deteriorate rapidly. The amount of money spent annually to rehabilitate sewers in rsponse to collapse incidents roughly equates to the estimated expenditures on all sewerage rehabilitation. It may therefore be concluded that very little planned renewal is being undertaken. Work is currently underway to divide the existing sewer system into three zones - Zone A will contain the dewers where rapid detrioration has a high probability, Zone B will have less frequent surveys and only gross defects will be dealt with, and zone C will have maintenance only in response to incidents. Assessment of the hydraulic performance of sewerage systems is even more difficult. The lack of analysis techniques and the known presence of many unrecorded storm overflows together with the transient and infrequent occurrence of flood-producing rainfall make it inevitable that many of the older sewer systems are also performing indifferently in the hydraulic sense. (Baker-FRC)

ADVANCED COATINGS FOR THE WATER INDUSTRY.
Water Services, Vol 86, No 1033, p 124-125, March, 1982.

Descriptors: *Coatings, *Corrosion control, *Water tanks, Waterproofing, Plastics.

Several protective coatings for use in the water industry are described. They waterproof but are generally vapor permeable. Decadex, for external tank use, is solar reflective. It protects stone, brick, concrete, slate, wood, and tile from water, weather, and most chemicals by a seamless application. Steridex, a fungistatic protective finish, is used in drinking water plants. Sterepel not only is fungistatic, it also kills insects and rodents. Firecheck is a flameproof coating. Isoclad protects metal structures from rust and salt spray attack. Soladex is an elastomeric solvent-based high-build barrier coating which protects a wide range of substrates from water penetration and corrosion. It is ideal for use in low temperature areas. These products are manufactured by Liquid Plastics Limited, Preston, England. (Cassar-FRC)

CROSS-COUNTRY FORCE MAIN.
Water/Engineerig and Management, Vol 129, No 7, p 47-48, June, 1982.

Descriptors: *Pipelines, *Wastewater disposal, *Plastics, Force mains, Hortonville, *Wisconsin, Polyethylene.

A $370,000 12 inch diameter high density polyethylene force main buried 7-9.5 ft deep carries wastewater effluent from the Hortonville, Wisconsin, treatment plant to the river 2.5 miles away. The route was chosen to bypass the town and reduce costs of digging up streets. A wildlife marsh was located only 50 ft from the plant, but effluent discharge there was not allowed without expensive tertiary treatment. Pipe sections were joined by heat fusion to form an essentially continuous conveyance, except for planned air release and access points. The flexible pipe is expected to perform well in the shifting, corrosive soil. (Cassar-FRC)

STATUS OF POROUS PAVEMENT RESEARCH,
Municipal Environmental Research Lab., Edison, NJ.
R. Field, H. Masters, and M. Singer.
Water Research, Vol 16, No 6, p 849-858, June, 1982. 11 Fig, 1 Tab, 8 Ref.

Descriptors: *Paving, *Porosity, *Infiltration, Storm runoff, Water pollution sources, Aquifer recharge, Flood control, Water pollution control.

The Porous Pavement Research Program of the Environmental Protection Agency is discussed, including information on the economics, advantages, potential applications, and status and future research needs of porous pavements. Such pavements are an available stormwater management technique which can be used on parking lots and low volume roadways to reduce both stormwater runoff volume and pollution. In addition, groundwater recharge is enhanced. Also, cost reductions result due to elimination of curbs, drains, and small sized storm sewers. Porous asphalt pavements consist of a relatively thin course of open graded asphalt mix over a deep base of large size crushed stones. Water can be stored in the crushed stone base until it can percolate into the subbase or drain laterally. Other porous pavement types include concrete lattice blocks and a porous concrete mix. If the possibility exists that water infiltrating the ground could reach a water supply aquifer, adequate protective means should be undertaken to determine that the surface runoff is not still contaminated when it reaches the aquifer. PRACTICAL CALCULATIONS AND RECOMMENDATIONS ON THE USE OF GUNPOWDER ROCK BREAKERS IN HYDROTECHNICAL CONSTRUCTION,
N. Ya. Orlov.
Hydrotechnical Construction, Vol 15, No 8, p 502-506, 1981. 3 Fig, 7 Ref. Translated from Gidrotekhnicheskoe Stroitel'stov, No 8, p 51-53, August, 1981.

Descriptors: *Rock excavation, *Hydraulic equipment, *Hydraulic properties, *Mathematical analysis, *Hydraulic engineering, Hydraulic design,

Equations, Hydraulic geometry, Rock properties, Strength, Explosives, Gundpower Rock Breakers.

The effectiveness of gunpowder rock breakers in fracturing old foundations and structures depends largely on the parameters of the hydraulic pulse. Fracture of the medium is possible where the maximum pressure in the pulse is > or = to the compressive strength strength of the medium. Equations are given to analyze the water-hammer phenomenon that occurs in the compressive phase of the pulse and determines the processes of dynamic compression of the fluid with interference of the shock waves and without outflow of the fluid into cracks. These take into account the design of the rock breaker, the geometry of the shothole, and the physical properties of the medium. They show that the elastic volume in the area of the anchor device greatly affects the reflection of the incident waves and slows the pressure increase in the pulse. The half-phases of the annular section and of the perforated part of the tube are important in attaining maximum pulse amplitude, and the inertia of the annular section is influential in shaping the pulse. Equations for measuring cracks occurring at the end of the compression phase and for determining the duration of the discharge phase are also given. Finally, calculations are given for fracturing a mass by means of several rock breakers acting simultaneously. (Gish-FRC)

NOTES ON THE CONSTRUCTION, INSTALLATION AND ENVIRONMENTAL EFFECTS OF HABITAT IMPROVEMENT STRUCTURES IN A SMALL LOWLAND RIVER IN SHROPSHIRE,
Liverpool Univ. (England). Dept. of Zoology.
S. Swales.
Fisheries Management, Vol 13, No 1, p 1-10, 1982. 8 Fig, 1 Tab, 22 Ref.

Descriptors: *Aquatic habitats, *Dams, *Deflection, *Fish management, Water depth, Habitats, Perry River, England, Turbulent flow, Channel improvement, Riffles, Flow velocity, Water currents.

Fish Habitat improvement structures were placed in the River Perry, a small lowland river in England, The channel had been dredged and widened on several occasions since 1900 to improve drainage conditions. In a 600 m reach two low dams (< 1 m high) and two current deflectors were installed. One deflector was put in a shallow fast-flowing area and the other in a deeper slow-flowing section. A floating plywood artificial cover was added to simulate overhanging bank vegetation and undercut banks. The dams increased water depth and reduced current velocity above the impoundment and decreased water depth and increased current velocity (maximum 80 cm per sec) downstream. Below the dams the greatly increased water turbulence scoured bed material, producing a pool and ripple pattern. Both current deflectors increased flow velocity (maximum 60 cm per sec) by narrowing the river channel, but only the one installed in the shallower, fast-flowing part of the river produced a pool-ripple pattern. The temporary covers effectively simulated natural cover but were damaged by winter floods. (Cassar-FRC)

HYDROACOUSTIC ASSESSMENT OF PELAGIC FISH STOCKS: A POTENTIAL NEW MANAGEMENT TOOL,
Vermont Univ., Burlington.
G. W. LaBar.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-256660, Price codes: AXX in paper copy, A01 in microfiche. Report, February, 1981. 35 p, 23 Fig, 4 Tab, 2 Ref. OWRT A-037-VT(1).

Descriptors: *Sonar, *Sound waves, *Fish populations, *Remote sensing, *Trawling, Fathometers, Sounding, Water depth, Aquatic populations, Populations, Aquatic life, Fisheries, Marine environment, Technology, Commercial fishing, Fish harvest, Aquatic animals, Fish, Smelt, Biomass, Aquatic productivity, Fish management, Acoustics.

Hydroacoustic assessment, a tool for employing sonar to assess fish area populations in fisheries and the marine environment, is receiving increased attention. Studies were carried out to develop a method of analyzing echograms employing echo density and variability concepts, to compare mean echo densities on echograms with catches from a midwater trawl and to compare echograms from various Lake Champlain sites at various time periods. Specifically, a dot-grid was used for analysis of echo density on the echograms in an attempt to determine relative abundance of pelagic fish. Highest echo-densities were generally noted between 60-100 feet. While significant echo count differences were found between depths, between Lake sites, and between times, no real pattern of echo count differences emerged. Correlation coefficients relating midwater trawl smelt catch numbers to mean echo counts at trawling depth were -0.02 for large (45 ft square mouth) and 0.37 for small (16 ft square mouth) trawls. However, the relationship between echo counts and biomass is unknown. While a combination of echo sounding needed before other standard assessment techniques can be eliminated. The method developed herein, however, has been demonstrated to Vermont fish and game personnel. (Zielinski-MAXIMA)

A NEW METHOD FOR REPORTING AND INTERPRETING TEXTURAL COMPOSITION OF SPAWNING GRAVEL,
Pacific Northwest Forest and Range Experiment Station, Corvallis, OR.
F. B. Lotspeich, and F. H. Everest.
Forest Service Research Note PNW-369, January 1981. 11 p, 3 Fig, 1 Tab, 10 Ref.

Descriptors: *Gravel, *Spawning gravel, Streambeds, *Sediment sampler, *Aquatic habitats, Larval growth stage, Permeability, Pore size.

Textural composition of spawning gravel influences survival and emergence of salmonid embryos. A new method has been developed for collecting, sorting, and interpreting gravel quality. Because both sediment distribution and redd site selection by salmonids are nonrandom events, the location from which samples are drawn should be identified by an experienced fishery biologist. Samples are collected with a tri-tube freeze-core device and dry-sorted using sieves based on the Wentworth scale. An index to the quality of gravel is obtained by dividing geometric mean particle size by the sorting coefficient (a measure of the distribution of grain sizes) of a sample. The resulting number is called the 'fredle index' and is proposed as a standard for evaluating the reproductive potential of spawning gravel. The magnitude of fredle numbers is a measure of both pore size and relative permeability, both of which increase as the index number becomes larger. Permeability and pore size control movement of water and alevins through gravel. This method of calculating a quality index for stream sediments allows identification of the quality of gravel used for reproduction by salmonids. Comparisons can be made of gravel quality within and between strams, and temporal changes in texture and permeability can be monitored. The technique should be especially useful for measuring changes in gravel quality resulting from sedimentation from nonpoint sources in managed forest watersheds. (Moore-SRC)

WATER RESOURCES RESEARCH SUPPORT PROGRAM 1981 - 1982.
Department of the Environment, Ottawa (Ontario).
1981. 12p, English and French.

Descriptors: Water resources, *Research projects, Inland waters, Universities, Quality, Pollutants, Modelling, Contamination, Hydraulics, Data collections, *Canada.

The Department of the Environment, on the recommendation of the Water Resources Research Support Program Review Group, has agreed to provide a total of $250,000 for water-related environmental research during 1981-81 to the Canadian university research community. The Water Resources Research Support Program provides for innovative research relevant to departmental concerns and responsibilities for water resources research in the natural and social sciences with emphasis on water management issues. By fostering the interest of university researchers, it thereby utilizes their knowledge and expertise in solving water research problems and provides opportunities for their participation in socially relevant environmental research. Fifteen universities across Canada will share the $250,000, which will be used to support both unidisciplinary research projects and multi- or interdisciplinary programs aimed at solving regional and national water research issues. Pesticide Accumulation in a New Impoundment in Iowa,
W82-06871 5B

AGRICULTURAL HYDROLOGY
Manual of Engineering of Irrigated Lands (Manual de Ingenieria de Regadios), Vol. 1.
W82-06375 3F

Manual of Engineering of Irrigated Lands (Manual de Ingenieria de Regadios), Vol. 2,
W82-06376 3F

AGRICULTURAL RUNOFF
Herbicide Loss in Runoff Water and Sediment as Affected by Center Pivot Irrigation and Tillage Treatments,
W82-05921 5B

Herbicides in Kansas Waters--Evaluations of the Effects of Agricultural Runoff and Aquatic Weed Control on Aquatic Food Chains,
W82-06304 5C

AGRICULTURAL WATERSHEDS
Variability of Stream Water Quality in Some Land Management Systems in the Southern Kakioka Basin, Japan,
W82-06020 5B

A Discrete System Storage Model for Analyzing Rainfall-Runoff Relationships,
W82-06219 2A

AGRICULTURE
China's Agro-Ecosystem,
W82-06019 3B

The Benefits of Water Management in Energy and Agricultural Development in the San Juan River Basin of New Mexico,
W82-06517 3E

Hydrology and Model of North Fork Solomon River Valley, Kirwin Dam to Waconda Lake, North-Central Kansas,
W82-06684 2A

Land Use Policy and Water Procurement (Agrarstrukturpolitik und Wassergewinnung),
W82-06714 6F

Consumptive Use of Water by Major Crops in the Southwestern United States,
W82-06964 3F

AIR CIRCULATION
Major Factors in Sewer Ventilation,
W82-06462 8A

On Accumulation of Water Substance in a Column of Rising Air,
W82-06581 2B

Spatial Coherence of Monthly Precipitation in the United States,
W82-06894 2B

AIR ENTRAINMENT
Hydraulic Jump, Air Entrainment and Slug Flow in Bottom Outlets (Wechselsprung, Lufteintrag Und Schwallformiger Abfluss in Grundablassen),
W82-06244 8B

AIR POLLUTION
Some Paleolimnological Aspects of the Most Recent Sediments of Lac Laflamme (Laurentides Provincial Park, Quebec) in Relation to Atmospheric Transportation of Pollutants,
W82-06577 5A

AIRPORTS
Planned Measures for Water Regulation Constructing the New Munich Airport (Geplante Wasserwirtschaftliche Massnahmen Beim Bau des Neuen Flughafens fur Munchen),
W82-06825 8A

ALABAMA
Plant Expansion Via High-Rate Pretreatment,
W82-05953 5F

Flood of May 5 and 6, 1981, Mobile, Alabama,
W82-06128 2E

Isolation and Characterization of Ultramicrobacteria from a Gulf Coast Estuary,
W82-06747 5A

Water Resources Data for Alabama, Water Year 1980--Volume 1. Apalachicola, Choctawatchee, Blackwater, Escambia, Perdido, and Alabama River Basins,
W82-06953 7C

Water Resources Data for Alabama, Water Year 1980--Volume 2. Tombigbee, Mobile, Dog, Pascagoula, and Tennessee River Basins,
W82-06954 7C

ALASKA
Effects of Acid on Plant Litter Decompostion in an Arctic,
W82-06737 5C

ALBEDO
Albedo Survey on Andrei Glacier, Iskut River Basin, B. C., Midsummer, 1980,
W82-06578 2C

ALBERTA
Biogeochemistry of Mountain Stream Waters: The Marmot System,
W82-06569 5B

Mutagenic Activity of Fish and Sediments in the Sheep River, Alberta,
W82-06770 5C

The Removal of a Headed Discharge From a Lake and the Effect Upon an Epiphytic Algal Community,
W82-06898 5C

ALDICARB
Determination of Aldicarb Residues in Water by Combined High Performance Liquid Chromatography Mass Spectrometry,
W82-06549 5A

ALFALFA
Moisture Conservation of Interseeded Grasslands Through the Use of Annual and Perennial Crop Barriers,
W82-06148 3F

ALGAE
Bioconcentration of a Hexachlorobiphenyl in Great Lakes Planktonic Algae,
W82-05991 5B

Application of X-Ray Microanalysis for the Detection of Heavy Metal in Great Lakes Algae,
W82-05993 5A

Influence of a Hexachlorobiphenyl in Great Lakes Phytoplankton in Continuous Culture,
W82-05994 5C

Physiological and Biochemical Responses of Several Freshwater Algae to a Mixture of Metals,
W82-05996 5C

A Sampling Study of the Brown Seaweed, Ascophyllum Nodosum as a Marine Monitor for Trace Metals,
W82-06050 5B

Application of a New Method for Quantitative Evaluation of Stream Benthic Algal Populations,
W82-06168 5C

Primary Productivity and Nutrients in the Sediment Retention Basin of Lake Monroe,
W82-06470 5C

Circulation Patterns; Their Investigation and Prediction,
W82-06477 5F

Effect of Hard Detergents on Algae in a High-Rate-Oxidation Pond,
W82-06538 5C

The Use of an Alga Chlorella Pyrenoidosa and a Duckweed Lemna Perpusilla as Test Organisms for Toxicity Bioassays of Spent Bleaching Liquors and Their Components,
W82-06721 5C

Pediastrum and Scenedesmus (Chlorococcales) in Sediments from Lake Vaxjosjon, Sweden,
W82-06878 5C

Effects of Macroalgal Mats on the Ecology of Intertidal,
W82-06893 5C

The Removal of a Headed Discharge From a Lake and the Effect Upon an Epiphytic Algal Community,
W82-06898 5C

Modern Lacustrine Stromatolites, Walker Lake, Nevada,
W82-06934 5C

Colonization and Growth of Attached Algae at the Lake Michigan Water Line,
W82-06976 5C

Investigation of Eutrophication Processes by Continuous Recording of Production and Destruction,
W82-06982 5C

ALGAL CONTROL
Nutrient Control of Blue-Green Algae in a Southwestern Reservoir,
W82-05912 5C

Evaluating Sediment Blankets and a Screen for Macrophyte Control in Lakes,
W82-06097 4A

ALGAL GROWTH
Algal Growth in Primary Settled Sewage--The Effects of Five Key Variables,
W82-06055 5D

Multistep Approach to Identification of Limiting Nutrients in Northern Adriatic Eutrophied Coastal Waters,
W82-06267 5C

Influence of Multicellular Configurations on Algal Growth in Aerated Lagoons,
W82-06662 5D

LIBRARY U. OF I., URBANA-CHAMPAIGN

Light Adaptation and Inhibition: Processes Important in Modelling the Growth of Algae in Drinking Water Basins,
W82-06827 5C

Growth Dynamics of Cladophora Glomerata in Western Lake Erie in Relation to Some Environmental Factors,
W82-06932 5C

Environmental Factors Controlling Physiological Changes in Cladophora in Lake Erie,
W82-06935 5C

Projected Cladophora Growth in Southern Georgian Bay in Response to Proposed Municipal Sewage Treatment Plant Discharges to the Mary Ward Shoals,
W82-06936 5C

Ecological Studies and Mathematical Modeling of Cladophora in Lake Huron: I. Program Description and Field Monitoring of Growth Dynamics,
W82-06939 5C

Ecological Studies and Mathematical Modeling of Cladophora in Lake Huron: 2. Phosphorus Uptake Kinetics,
W82-06940 5C

Biomass and Distribution of Cladophora Glomerata in Relation to Some Physical-Chemical Variables at two Sites in Lake Erie,
W82-06941 5C

Monitoring Cladophora Growth Conditions and the Effect of Phosphorus Additions at a Shoreline Site in Northeastern Lake Erie,
W82-06942 5C

The Use of Remote Sensing to Map the Areal Distribution of Cladophora Glomerata at a Site in Lake Huron,
W82-06973 5B

Colonization and Growth of Attached Algae at the Lake Michigan Water Line,
W82-06976 5C

Effects of Phosphorus Enrichment and Wave Simulation of Populations of Ulothrix Zonata from Northern Lake Superior,
W82-06979 5C

ALGICIDES
Influence of Stabilizer Concentration on Effectiveness of Chlorine as an Algicide,
W82-06539 5F

ALGORITHMS
A Multiobjective Branch-and-Bound Method for Planning Wastewater and Residual Management Systems,
W82-06149 6A

ALLUVIAL AQUIFER
Water-Level Map of the Mississippi Delta Alluvium in Northwestern Mississippi, April 1981,
W82-06138 7C

ALLUVIAL AQUIFERS
Evaluation of the Water Resources Potential of the Lower Missouri River Valley Alluvium,
W82-06696 6B

ALLUVIAL CHANNELS
Mathematical Model for Erodible Channels,
W82-06336 2J

Hydrologic and Morphologic Changes in Channels of the Platte River Basin: A Historical Perspective,
W82-06946 2E

ALLUVIUM
Evaluation of the Water Resources Potential of the Lower Missouri River Valley Alluvium,
W82-06696 6B

ALPINE REGIONS
Microbial Dynamics of an Epilithic Mat Community in a High Alpine Stream,
W82-06729 2E

ALTITUDE
Regional Water Balance on the Arctic Tundra in Summer,
W82-06061 2D

AMES TEST
On the Detection of Mutagenic/Carcinogenic Activities in Water with the Salmonella/Microsome Test (Ames Test)(Zum Nachweis Mutagener/Kanzerogener Aktivitaten in Wassern mit dem Salmonella/Mikrosomen-Test (Ames-Test)),
W82-06715 5A

AMMONIA
Ammonia Nitrogen Removal in Facultative Wastewater Stabilization Ponds,
W82-06454 5D

Multiple Potentiometric System for Continuous Determination of Chloride, Fluoride, Nitrate, and Ammonia in Natural Waters,
W82-06718 5A

ANADROMOUS FISH
Forest Management and Anadromous Fish Habitat Productivity,
W82-06965 5C

ANAEROBIC CONDITIONS
Biological Equilibrium in a Wastewater Reservoir,
W82-06282 5D

Anaerobic Processes,
W82-06923 5D

ANAEROBIC DIGESTION
Immobilized Microbes and a High-Rate, Continuous Waste Processor for the Production of High Btu Gas and the Reduction of Pollutants,
W82-06005 5D

Modified Sludge Digestion with Improved Gas Yield (Modifizierte Schlammfaulung Mit Verbesserter Gasausbeute).
W82-06024 5D

Product Inhibition in the Acid Forming Stage of the Anaerobic Digestion Process,
W82-06041 5D

Comparison of the Extractabilities of Zn, Cu, Ni and Cr from Sewage Sludges Prepared by Treating Raw Sewage with the Metal Salts Before or After Anaerobic Digestion,
W82-06079 5D

Treatment of Pulp and Paper Industry Wastewaters in an Anaerobic Fluidized Bed Reactor,
W82-06226 5D

Anaerobic Filter Treatment of Molasses Distillery Slops,
W82-06312 5D

Environmental Residuals and Capital Costs of Energy Recovery from Municipal Sludge and Feedlot Manure,
W82-06405 5E

The Behaviour of Nitrilotriacetic Acid During the Anaerobic Digestion of Sewage Sludge,
W82-06667 5D

The Effect of Increased Nickel Ion Concentrations on Microbial Populations in the Anaerobic Digestion of Sewage Sludge,
W82-06832 5D

ANAEROBIC LAGOONS
Elimination of Odor from Anaerobic Lagoons,
W82-06221 5D

ANIMAL WASTES
Efffect of Cattle Manure on Soil Erosion by Water,
W82-06834 4D

ANION EXCHANGE
Oriented Monolayer Assemblies to Modify Fouling Propensities of Membranes.
W82-06167 3A

ANTECEDENT MOISTURE
Antecedent Moisture Condition Probabilities,
W82-06451 2A

APPALACHIAN REGION
Effects of a Dam and Sewage Outflow on a Small Oligotrophic Stream in the Southern Appalachians,
W82-06966 5C

APPLICATION EQUIPMENT
Sprinkler Leveler and Wind Compensating Device,
W82-06164 3F

APPLICATION RATES
Land Disposal of Sewage Sludge, A Summary of Research Results, 1972-1980,
W82-06377 5E

AQUACULTURE
Aquaculture for Waste Management,
W82-06556 5D

AQUATIC ANIMALS
A Faunal Analysis of the Springs off the Ouachita Mountains, Arkansas,
W82-06161 2K

AQUATIC FOOD CHAINS
Herbicides in Kansas Waters--Evaluations of the Effects of Agricultural Runoff and Aquatic Weed Control on Aquatic Food Chains,
W82-06304 5C

AQUATIC FUNGI
Factors Affecting the Distribution of Lignicolous Marine Fungi in Hong Kong,
W82-06908 5B

AQUATIC HABITAT
Evaluation of the Stream Reach Inventory and Channel Stability Index for Instream Habitat Analysis,
W82-06308 4D

AQUATIC HABITATS
Notes on the Construction, Installation and Environmental Effects of Habitat Improvement Structures in a Small Lowland River in Shropshire,
W82-06084 8I

A New Method for Reporting and Interpreting Textural Composition of Spawning Gravel,
W82-06395 8I

Habitat Recovery in the North Fork of the Teton River.
W82-06409 6G

Two Techniques for Locating and Sampling Brown Trout Microhabitat Under Complete Ice Cover,
W82-06703 7B

Forest Management and Anadromous Fish Habitat Productivity,
W82-06965 5C

AQUATIC LIFE
Manganese-54 Accumulation by Chlorella SPP., Daphnia Magna and Yellow Perch (Perca Flavescens).
W82-06904 5B

AQUATIC PLANTS
Biocleansing with Aquatic Weeds: A Means of Removing Asbestiform Fibers from Water,

Seasonal and Long-Term Changes in Surface Cover of Aquatic Plants in a Shallow Pond, Ojaga-Ike, Chiba, Japan,
W82-06900 5C

AQUATIC PRODUCTIVITY
Stream Rehabilitation Following Treatment for Phosphorus Removal: Pre-Treatment Assessment,
W82-05919 5G

AQUATIC SOILS
Evaluation of Bacterial Binding and Release of Cadmium from Aquatic Sediments,
W82-05934 5C

AQUATIC WEED CONTROL
Herbicides in Kansas Waters--Evaluations of the Effects of Agricultural Runoff and Aquatic Weed Control on Aquatic Food Chains,
W82-06304 5C

AQUEDUCTS
Redevelopment of Aqueduct Crossing of Manchester Ship Canal and River Mersey,
W82-06813 8A

AQUIFER CHARACTERISTICS
Lineaments and Fracture Traces, Jennings County and Jefferson Proving Ground, Indiana,
W82-06675 2F

Hydrology and Model of North Fork Solomon River Valley, Kirwin Dam to Waconda Lake, North-Central Kansas,
W82-06684 2A

AQUIFER MANAGEMENT
Sensible Energy Storage in Aquifers. 1. Theoretical Study,
W82-06059 4B

An Optimization Algorithm in a System for Management of the Regional Safe Groundwater Yield,
W82-06616 4B

Artificial Recharge of Colorado River Water in Las Vegas Valley: Management Options and Potential Aquifer System Responses,
W82-06694 6B

AQUIFER PROPERTIES
Identification of Aquifer Transmissivities: The Comparison Model Method,
W82-06859 2F

AQUIFER SYSTEMS
A Numerical Model of Aquifer Tests in Multi-Layered Aquifer/Aquitard Systems,
W82-05943 2F

Hydrogeologic Data from Selected Wells and Test Holes in Suffolk County, Long Island, New York, 1972-80,
W82-06131 7C

AQUIFER TESTING
A Numerical Model of Aquifer Tests in Multi-Layered Aquifer/Aquitard Systems,
W82-05943 2F

AQUIFERS
The Law of International Aquifers,
W82-05940 6E

Florida Style Water Supply and Treatment,
W82-06027 5F

Development of Prediction Equations for a Phreatic Aquifer in Response to Infiltration: Dimensional Analysis,
W82-06066 2F

Potentiometric Map of the Sparta Aquifer System in Mississippi, Fall 1980,
W82-06135 7C

Spilled Petroleum Recovered from Atop Water Table of Mississippi Aquifer,
W82-06185 5G

Evaluation of Groundwater Resources in Tokar Delta, Sudan,
W82-06197 2E

Steady State Perched Groundwater Mounds on Thick Sublayers,
W82-06317 2F

Examination of Probable Causes of Individual Water Supply Contamination,
W82-06435 5B

A Two-Dimensional, Finite Element Model of Salt Water Intrusion in Groundwater Systems,
W82-06525 4B

Potentiometric Map of the Cockfield Aquifer in Mississippi, Fall 1980,
W82-06676 7C

Ground Water in the Piedmont Upland of Central Maryland,
W82-06686 2F

A Dimensionless Parameter Approach to the Thermal Behavior of an Aquifer Thermal Energy Storage System,
W82-06861 2F

Numerical Treatment of Leaky Aquifers in the Short Time Range,
W82-06863 2F

Saltwater Encroachment in an Aquifer: A Case Study,
W82-06864 2F

AQUITARDS
A Numerical Model of Aquifer Tests in Multi-Layered Aquifer/Aquitard Systems,
W82-05943 2F

ARCTIC ZONE
Regional Water Balance on the Arctic Tundra in Summer,
W82-06061 2D

Evaporation from the Surface of the Arctic Tundra on Axel Heiberg Island,
W82-06065 2D

AREAL HYDROGEOLOGY
Hydrogeologic Data from Selected Wells and Test Holes in Suffolk County, Long Island, New York, 1972-80,
W82-06131 7C

ARID AREAS
An Economic Comparison of the Irrigation of Corn in Humid and Arid Regions of the United States,
W82-05909 6B

ARIZONA
Consumptive Use of Water by Major Crops in the Southwestern United States,
W82-06964 3F

ARKANSAS
Estimating Water Demand Schedules for Selected Industries in Arkansas,
W82-06160 6D

A Faunal Analysis of the Springs off the Ouachita Mountains, Arkansas,
W82-06161 2K

Radionuclides in Dardanelle Lake in the Area of the Nuclear I Facility: 1979-1981,
W82-06169 5B

A Benefit Cost Analysis of a Soil Erosion Control Program for the Northern Watershed of Lake Chicot, Arkansas,
W82-06170 4D

Water-Resources Investigations of the U. S. Geological Survey in Arkansas--Fiscal year 1981.
W82-06673 7C

Controlling Agricultural Soil Loss in Arkansas' North Lake Chicot Watershed: A Cost Analysis,
W82-06796 4D

Reservoir Water Quality Sampling Design,
W82-06868 2H

AROMATIC COMPOUNDS
Simple Procedures for Enrichment of Chlorinated Aromatic Pollutants from Fat, Water and Milk for Subsequent Analysis by High-Resolution Methods,
W82-06015 5A

Comparative Study on Organic Constituents in Polluted and Unpolluted Inland Aquatic Environments--III. Phenols and Aromatic Acids in Polluted and Unpolluted Waters,
W82-06033 5A

Separation of Aqueous Organic Mixtures by Pervaporation and Analysis by Mass Spectrometry or a Coupled Gas Chromatograph-Mass Spectrometer,
W82-06791 5A

ARSENATES
Adsorption of Arsenite and Arsenate on Amorphous Iron Hydroxide,
W82-06311 5D

ARSENIC
Adsorption of Arsenite and Arsenate on Amorphous Iron Hydroxide,
W82-06311 5D

ARTESIAN CAPACITY
Calculations of the Capacity of Water Intakes with Consideration of Groundwater Leakage Through Steeply Dipping, Poorly Permeable Deposits,
W82-06617 2F

ARTIFICIAL RECHARGE
Artificial Recharge of Colorado River Water in Las Vegas Valley: Management Options and Potential Aquifer System Responses,
W82-06694 6B

Field Study of Organic Water Quality Changes during Groundwater Recharge in the Palo Alto Baylands,
W82-06831 5B

ASBESTOS
Biocleansing with Aquatic Weeds: A Means of Removing Asbestiform Fibers from Water,
W82-06363 5F

ASSAY
Ames Salmonella Mutagenicity Assays on Water: Dichloromethane Extracts Versus Preparation of Growth Media with Test Samples.
W82-06548 5A

ATLANTIC OUTER-CONTINENTAL SHELF
Summary of Hydrologic Testing in Tertiary Limestone Aquifer, Tenneco Offshore Explora-

LIBRARY U. OF I., URBANA-CHAMPAIGN

tory Well--Atlantic OCS, Lease-Block 427 (Jacksonville NH 17-5),
W82-06685 2F

ATMOSPHERE
Transpirational Supply and Demand: Plant, Soil, and Atmospheric Effects Evaluated by Simulation,
W82-06320 2D

Ecological Optimality in Water-Limited Natural Soil-Vegetation Systems 1. Theory and Hypothesis,
W82-06321 2I

ATMOSPHERIC WATER
Estimation of the Precipitable Water from the IR Channel of the Geostationary Satellite,
W82-06995 7B

ATOMIC ABSORPTION SPECTROMETRY
Liquid-Liquid Extraction Combined with Atomic-Absortpion Spectrometry for Determination of Copper in Waters, Foods and Analytical Reagents Using 1,2-Naphthoquinone Thiosemicarbazone,
W82-06179 5A

ATRAZINE
Herbicides in Kansas Waters--Evaluations of the Effects of Agricultural Runoff and Aquatic Weed Control on Aquatic Food Chains,
W82-06304 5C

AUSTRALIA
Depositional Model for a Chenier Plain, Gulf of Carpentaria, Australia,
W82-05957 2J

Mercury Contamination of the Lerderderg River, Victoria, Australia, from an Abandoned Gold Field,
W82-06194 5B

On Predicting the Onset of the Australian Wet Season at Darwin,
W82-06208 2B

Polychlorinated Biphenyls (PCBS): An Australian Viewpoint on a Global Problem,
W82-06232 5B

Investigations into the Nitrification of Sydney's Wastewaters,
W82-06724 5D

AUSTRIA
The Annabrucke River Power Station on the Drau, Constructions Taken to Prevent Erosion in the Vicinity of the Barrage on an Exceptional Subsoil (Das Draukraftwerk Annabrucke, Massnahmen zur Verhinderung der Erosion in Bereich Des Bauwerkes auf Aussergewohnlichem Untergrund),
W82-06636 8E

AUTOMATIC SAMPLING
Evaluation of a System to Automatically Sample Zooplankton from the Discharge of Dams,
W82-06628 5A

AUTOMATION
Automation of a Sprinkler Irrigation System by the Utilization of Real Time Weather Information,
W82-06695 3F

AVAILABLE WATER
Availability and Quality of Water from Underground Coal Mines in Johnson and Martin Counties, Kentucky,
W82-06136 3B

BACKWASH
The Effect of Backwashing Rate on Filter Performance,
W82-06415 5F

Molecular (Osmotic and Electro-Osmotic) Backwash of Cellulose Acetate Hyperfiltration Membranes,
W82-06792 3A

BACTERIA
Enteric Bacteria in Sugarbeet Refinery Processing Waste Waters,
W82-06195 5D

Nonstandard Methods for Enumerating Bacteria in Drinking Water,

BAYER 73
A Rapid High-Performance Liquid-Chromatographic Method for Simultaneously Determining the Concentrations of TFM and Bayer 73 in Water During Lampricide Treatments,
W82-06495 5A

BAYS
Tragedy of the San Francisco Bay Commons,
W82-06182 6E

BEACH EROSION
The Role of the Akosombo Dam on the Volta River in Causing Coastal Erosion in Central and Eastern Ghana (West Africa),
W82-06100 2J

BED SEDIMENT
Bed-Material Size and the Riffle-Pool Sequence,
W82-05958 2J

BELGIUM
Observations on the Immature Chironomidea of Polluted Lowland Brook-Pond System (Antwerp, Belgium), Aerated by the Phallus Process,
W82-06912 5G

BENEFICIAL USE
Fact Finding Hearing - Cottonwood Creek Instream Beneficial Use Program,
W82-06522 6B

BENEFITS
Doubts Remain About Bura Economics,
W82-06816 3F

BENTHIC ENVIRONMENT
A Method for Estimating the Respiration of Mud Communities in Shallow Running Water,
W82-06036 5C

BENTHIC FAUNA
Factors Affecting Depth Distribution of Dragonflies and Other Benthic Insects in a Thermally Destabilized Reservoir,
W82-06899 5C

Modification of Benthic Insect Communities in Polluted Streams: Combined Effects of Sedimentation and Nutrient Enrichment,
W82-06903 5C

The Distribution of Aquatic Oligochaetes in Brackish Inland Waters in the SW Netherlands,
W82-06905 5B

BENTHIC FLORA
Application of a New Method for Quantitative Evaluation of Stream Benthic Algal Populations,
W82-06168 5C

BENTHOS
Secondary Benthic Production in a Tropical Island Stream,
W82-06933 5C

BENZOTHIAZOLES
A Review of Benzothiazoles in the Aquatic Environment,
W82-06571 5C

BIOACCULULATION
Bioaccumulation and Toxicity of Heavy Metals and Related Trace Elements,
W82-06812 5C

BIOACCUMULATION
Bioconcentration of a Hexachlorobiphenyl in Great Lakes Planktonic Algae,
W82-05991 5B

BIOASSAY
A Practical and Reliable Method for Monitoring the Toxicity of Aquatic Samples,
W82-05951 5A

A Bioassay Technique Using Tetrahymena Pyriformis for the Rapid Assessment of Toxicants in Water,
W82-06032 5A

Effects of Suspended Volcanic Sediment on Coho and Chinook Salmon in the Toutle and Cowlitz Rivers,
W82-06706 5C

Multiple Addition Bioassay of Tjeukemeer Water,
W82-06907 5C

BIOASSAYS
The Use of an Alga Chlorella Pyrenoidosa and a Duckweed Lemna Perpusilla as Test Organisms for Toxicity Bioassays of Spent Bleaching Liquors and Their Components,
W82-06721 5C

Bioassays - Procedures and Results,
W82-06810 5A

BIOASSY
Bioassy Trials with Twenty Three Pesticides to a Fresh Water Teleost, Saccobranchus Fossilis,
W82-06031 5C

BIOCHEMICAL OXYGEN DEMAND
Reliability Analysis of BOD Kinetics in a Southern Stream Governed by the Discharge of an Oxidation Pond,
W82-06159 5B

Studies of BOD Inhibition in Presence of Inorganic Heavy Metals,
W82-06436 5C

Comparison of BOD Relationships for Typical Edible and Petroleum Oils.
W82-06458 5D

BIOCHEMICAL TESTS
Developing an ATP Index for Degradation of Drinking Water Quality by Attached Microbes,
W82-05932 5F

BIOFILMS
Dynamics of Biofilm Processes: Methods,
W82-06666 5D

BIOGEOCHEMISTRY
Biogeochemistry of Mountain Stream Waters: The Marmot System,
W82-06569 5B

BIOINDICATORS
Developing an ATP Index for Degradation of Drinking Water Quality by Attached Microbes,
W82-05932 5F

Peripheral Effects of Cadmium on the Blood and Head Kidney in the Brown Bullhead (Ictalurus Nebulosus),
W82-06003 5C

A Sampling Study of the Brown Seaweed, Ascophyllum Nodosum as a Marine Monitor for Trace Metals,
W82-06050 5B

Diatom Assemblages as Indicators of Water Quality in Freshwater Habitats of Guam,
W82-06146 5A

The Benefits of Pre-Operational Baseline Aquatic Biology Studies,
W82-06235 5A

Evaluation of Coliphage Detection as a Rapid Indicator of Water Quality,
W82-06537 5A

Algae and Crustaceans as Indicators of Bioactivity of Industrial Wastes,
W82-06654 5A

Microbiology: Water,
W82-06924 5B

BIOLOGICAL ACTIVATED FILTRATION
Advanced Water Treatment for Color and Organics Removal,
W82-06279 5F

BIOLOGICAL OXIDATION
Apparatus for High-Efficient Microbiological Oxidation Treatment,
W82-06166 5D

BIOLOGICAL OXYGEN DEMAND
Development of Wastewater Purification in the Ruhr Catchment Area and its Effects on Water Quality in the 1970's (Entwicklung Der Abwasserreinigung Im Ruhr Einzugsgebiet Und Ihre Auswirkungen Auf Die Gewassergute In Den Siebzieger Jahren),
W82-06469 5D

Investigations on Loading and Quality of Discharge of Municipal Sewage Treatment Plants in the Case of Stormwater Inflow (Utersuchungen Uber Belastung Und Ablaufbeschaffenheit Kommunaler Klaranlagen Bei Mischwasserzufluss),
W82-06634 5D

BIOLOGICAL SAMPLES
Selected Biological Characteristics of Streams in the Southeastern Uinta Basin, Utah and Colorado,
W82-06140 7C

The Relative Abundance of Opossum Shrimp, Mysis Relicta, in Twin Lakes, Colorado Using a Benthic Trawl,
W82-06399 6G

LIBRARY U. OF I., URBANA-CHAMPAIGN

BIOLOGICAL TREATMENT
High Rate Biological Treatment of TMP Effluent,
W82-05955 5D

Immobilized Microbes and a High-Rate, Continuous Waste Processor for the Production of High Btu Gas and the Reduction of Pollutants,
W82-06005 5D

Scanning Electron Microscope Evaluation of Rotating Biological Contactor Biofilm,
W82-06047 5D

Simplified Clarifier Axes Treatment Stages,
W82-06820 5D

The Effect of Increased Nickel Ion Concentrations on Microbial Populations in the Anaerobic Digestion of Sewage Sludge,
W82-06832 5D

BIOLOGICAL WASTEWATER TREATMENT
Oxidation of Aqueous Phenol Solutions in the Presence of Polyelectrolytes,
W82-06283 5D

Evaluation of Biological Nitrification - Denitrification at Penticton, British Columbia,
W82-06379 5D

Pilot Scale Assessment of the Biological Fluidized Bed Process for Municipal Wastewater Treatment.
W82-06380 5D

Monitoring of Selected Trace Organics During Biological Wastewater Treatment,
W82-06392 5D

Ammonia Nitrogen Removal in Facultative Wastewater Stabilization Ponds,
W82-06454 5D

Industrial Wastes as Carbon Sources in Biological Denitrification,
W82-06457 5D

Development of Wastewater Purification in the Ruhr Catchment Area and its Effects on Water Quality in the 1970's (Entwicklung Der Abwasserreinigung Im Ruhr Einzugsgebiet Und Ihre Auswirkungen Auf Die Gewassergute In Den Siebzieger Jahren),
W82-06469 5D

Performance of Rotating Biological Contactors Under Field Conditions,
W82-06650 5D

Continuous Dentrification by Immobilized Cells (Denitrification en Continu a l'Aide de Microorganismes Immobilises sur des Supports Solides),
W82-06830 5D

BIOMASS
A Conceptual Model of Primary Productivity in Shallow Streams Using Biomass Simulation,
W82-06153 5C

Sampling Characteristics of Macrophyte Biomass,
W82-06779 5A

BIOTRANSFORMATION
Biotransformation of PCB by Natural Assemblages of Freshwater Microorganisms,
W82-06719 5B

BLACK CANYON
Influence of Dredging and High Discharge on the Ecology of Black Canyon,
W82-06091 6G

BLACK EARTH CREEK
Climate Variation and the Mobility and Storage of Sediment in Watersheds,
W82-05931 4D

BLEACHING WASTES
Environmental Aspects of Some Alternative Pulp Bleaching Techiques,
W82-05913 5D

The Use of an Alga Chlorella Pyrenoidosa and a Duckweed Lemna Perpusilla as Test Organisms for Toxicity Bioassays of Spent Bleaching Liquors and Their Components,
W82-06721 5C

BLOOMINGTON DAM
Bloomington Lake - Potomac River Water Resources Project,
W82-06183 8A

BOATING
The Effect of Boat Activity on Turbidity in a Shallow Broadland River,
W82-06330 5C

BOG LAKES
UV-Sensitive Complex Phosphorus: Association with Dissolved Humic Material and Iron in a Bog Lake,
W82-06930 5C

BOGS
Size and Shape in Raised Mire Ecosystems: A Geophysical Model,
W82-06215 2G

UV-Sensitive Complex Phosphorus: Association with Dissolved Humic Material and Iron in a Bog Lake,
W82-06930 5C

BOILER WATER
Operating Experiences on a Reverse Osmosis Plant Which Converts Sea Water into Boiler Feed Water,
W82-05976 3A

BOISE RIVER
Evaluation of Models and Procedures Used for River Operations and Planning in the Upper Snake and Boise Rivers in Idaho,
W82-05925 4A

BOREHOLES
Vadose Zone Permeability Tests: Summary,
W82-06301 2G

Vadose Zone Permeability Tests: Steady State Results,
W82-06302 2G

Vadose Zone Permeability Tests: Unsteady Flow,
W82-06303 2G

BOTTOM OUTLETS
Aeration at Floor Offsets in Bottom Outlets (Beluftung an Sohlsprungen Von Grundablassen),
W82-06242 8C

Confluence of Two Jets Created by Two Parallel Segment Gates of a Bottom Outlet (Schussstrahl-Zusammenfuhrung Bei Einem Grundablass Mit Nebeneinyanderliegenden Segmentschutzen).
W82-06243 8B

Hydraulic Jump, Air Entrainment and Slug Flow in Bottom Outlets (Wechselsprung, Lufteintrag Und Schwallformiger Abfluss in Grundablassen),
W82-06244 8B

BOTTOM SAMPLING
The Distribution of Heavy Metals in the Bottom Sediments of Three Streams in the Kansas City, Missouri, Metropolitan Area,
W82-06702 5B

BOTTOM SEDIMENT
Survival of Escherichia Coli in Lake Bottom Sediment,
W82-06741 5B

BOUNDARIES
The Moving Interface Problem with Finite Elements,
W82-06546 2L

BOUNDARY LAYERS
Hereditary Phenomena in Turbulent Boundary Layers,
W82-06618 8B

BRACKISH WATER
The Acute Toxicity of Motor Fuels to Brackish Water Organisms,
W82-05985 5C

The Distribution of Aquatic Oligochaetes in Brackish Inland Waters in the SW Netherlands,
W82-06905 5B

BRAZOS RIVER
Environmental Assessment; Geothermal Direct Heat Project; Marlin Texas.
W82-06404 6G

BREAKWATERS
Canadian Wave Climate Study: Organization and Operation,
W82-06393 8B

BRIDGE DESIGN
Optimal Risk-Based Hydraulic Design of Bridges,
W82-06432 8A

Hydraulic Analysis, Paint Creek at State Route 772, Chillicothe, Ohio,
W82-06948 8B

BRIDGES
Devon Floods and the Waterways of Bridges,
W82-05948 8A

Statistical Search for High Water at Board Landing Bridge, Truro, Nova Scotia,
W82-06394 2L

Floodflow Characteristics of Honcut Creek at State Highway 70 Bridges Near Live Oak, California,
W82-06945 4A

BRIISH COLUMBIA
Potential Evaporation in the Peace Region of British Columbia,
W82-06528 2D

BRINE WASTES
Magnesium Oxide Production from Concentrated Brines,
W82-06111 3A

BRITISH COLUMBIA
Vegetation Structure and Diversity Components of a Fraser Estuary Tidal Marsh,
W82-06465 2L

Albedo Survey on Andrei Glacier, Iskut River Basin, B. C., Midsummer, 1980,
W82-06578 2C

Changes in Extractable Metal Concentrations During Storage of Surface Water Samples Containing Sediments,
W82-06630 2K

Attached and Free-Floating Bacteria in a Diverse Selection of Water Bodies,
W82-06887 5B

BUBBLE DIFFUSERS
New Bubble Diffusers Reduce Treatment Costs,
W82-06513 5D

BUBBLES
Domes, Bubbles, and Paper Waste,
W82-06025 5D

BUFFER CAPACITY
A Simplified Buffer Capacity Model for Sanitary Landfill Leachate,
W82-06038 5B

CABLEGATION
Cablegation: II. Simulation and Design of the Moving-Plug Gated Pipe Irrigation System,
W82-05963 3F

CADMIUM
Evaluation of Bacterial Binding and Release of Cadmium from Aquatic Sediments,
W82-05934 5C

Peripheral Effects of Cadmium on the Blood and Head Kidney in the Brown Bullhead (Ictalurus Nebulosus),
W82-06003 5C

Transport of Iron, Manganese, Cadmium, Copper, and Zinc by Magela Creek, Northern Territory, Australia,
W82-06054 5B

Effects of pH, Temperature, and eH on the Uptake of Cadmium by Bacteria and an Artificial Sediment,
W82-06580 5B

Cadmium in Gammaridae (Amphipoda: Crustacea) of the Rivers Werra and Weser-II. Seasonal Variation and Correlation to Temperature and Other Environmental Variables,
W82-06659 5B

CALCIUM
Fractionation of Metal Forms in Natural Waters by Size Exclusion Chromatography with Inductively Coupled Argon Plasma Detection,
W82-06545 5A

CALCIUM CARBONATE PREVENTION
Morphology of Inhibitor-Treated CaCo3 Precipitate,
W82-06120 3A

CALCIUM HYDROXIDE
Effect of Magnesium and Calcium Precipitation on Coagulation-Flocculation with Lime,
W82-06053 5D

CALCIUM SULFATE
Scale Inhibition of Calcium Sulfate by a Fluidized Bed,
W82-06104 3A

CALIBRATIONS
Calibrating A Mountain Watershed in Wyoming,
W82-06583 2E

CALIFORNIA
Solving a Poor Oxygen Transfer Problem.
W82-05952 5D

Water-Quality Assessment of Cache Creek, Yolo, Lake, and Colusa Counties, California,
W82-06130 7A

Environmental Problems and Geothermal Permitting,
W82-06217 6G

Institutional Aspects Affecting Management of Groundwater in California,
W82-06700 6B

Geosmin and 2-Methylisoborneol from Cyanobacteria in Three Water Supply Systems,
W82-06740 5F

Field Study of Organic Water Quality Changes during Groundwater Recharge in the Palo Alto Baylands,
W82-06831 5B

Floodflow Characteristics of Honcut Creek at State Highway 70 Bridges Near Live Oak, California,
W82-06945 4A

Management of Watershed Rehabilitation-- Reflections from Mt. St. Helens and Redwood Creek,
W82-06968 4D

CAMP SITES
Carrying Capacity for the Illinois River,
W82-05927 6G

CANADA
Factors Influencing Orthophospate Turnover Times: A Comparision of Canadian and New Zealand Lakes,
W82-05992 2H

Geochemical Factors Controlling the Accumulation and Dispersal of Heavy Metals in the Bay of Fundy Sediments,
W82-06188 2K

Sediment Character and Provenance in a Complex Fjord; Howe Sound, British Columbia,
W82-06189 2J

Correlations Between Predominant Heterotrophic Bacteria and Physicochemical Water Quality Parameters in Two Canadian Rivers,
W82-06544 5B

Water Resources Research Support Program 1981 - 1982.
W82-06565 9D

The OECD Cooperative Programme on Eutrophication; Canadian Contribution, Summary Report,
W82-06566 5A

The OECD Cooperative Programme on Eutrophication Canadian Contribution, Summary Report, (Supplement),
W82-06567 7C

Proportion of Methylmercury to the Total Amount of Mercury in River Waters in Canada and Japan,
W82-06609 5B

CANAL DESIGN
Canals in Sand Channels,
W82-06196 8B

CANAL EMBANKMENTS
Laboratory Investigation of Deformations of Canals in Sand,
W82-06990 8B

CANAL LININGS
Canal Tunnel Repair Options.
W82-06758 8A

CANAL SEEPAGE
Application of Thermal Infrared Imagery to Canal Leakage Detection,
W82-06994 7B

CANALS
Assessment of Water Quality in Canals of Eastern Broward County, Florida, 1969-74,
W82-06682 5A

Laboratory Investigation of Deformations of Canals in Sand,
W82-06990 8B

CANOPY
Ecological Optimality in Water-Limited Natural Soil-Vegetation Systems 1. Theory and Hypothesis,
W82-06321 2I

Ecological Optimality in Water-Limited Natural Soil-Vegetation Systems 2. Tests and Applications,
W82-06322 2I

CARBAMATE PESTICIDES
Determination of Aldicarb Residues in Water by Combined High Performance Liquid Chromatography Mass Spectrometry,
W82-06549 5A

CARBON
Effect of Carbon-Oxygen and Carbon-Sulfur Surface Complexes on the Adsorption of Mercuric Chloride in Aqueous Solutions by Activated Carbons,
W82-06788 5D

CARBON DIOXIDE
Carbon-Dioxide Neutralization of an Alkaline Effluent,
W82-05973 5D

A Method for Estimating the Respiration of Mud Communities in Shallow Running Water,
W82-06036 5C

Basic Studies on Carbon Dioxide/Air Control System for Activated Sludge Processes,
W82-06833 5D

CARBONATES
Modern Lacustrine Stromatolites, Walker Lake, Nevada,
W82-06934 5C

CARCINOGENS
Trihalomethane Formation in Water Treatment Plants in North Carolina,
W82-06158 5F

Investigation of the Chemical Nature and Possible Toxicity of Products Formed During the Ozone Disinfection of Drinking Water Containing Organic Substances,
W82-06173 5F

On the Detection of Mutagenic/Carcinogenic Activities in Water with the Salmonella/Microsome Test (Ames Test)(Zum Nachweis Mutagener/Kanzerogener Aktivitaten in Wassern mit dem Salmonella/Mikrosomen-Test (Ames-Test)),
W82-06715 5A

CARRYING CAPACITY
Carrying Capacity for the Illinois River,
W82-05927 6G

Carrying Capacity of Flood Plains,
W82-06428 2E

CATCHMENT AREAS
New Problems with Upland Waters,
W82-06602 5G

The Control of Effluent and Water Quality in an Important Water Supply Catchment,
W82-06652 5G

CATCHMENT BASINS
Geomorphic Parameters of Representative Basins and Their Hydrologic Significance,
W82-06384 2A

CATFISH
Peripheral Effects of Cadmium on the Blood and Head Kidney in the Brown Bullhead (Ictalurus Nebulosus),
W82-06003 5C

LIBRARY U. OF I., URBANA-CHAMPAIGN

Immune Response to a Formalin-Treated Bacterial Exotoxin (Toxoid) of Channel Catfish Maintained in a Recirculating Water-Reuse System,
W82-06707 5C

CAVES
Cave Water--Java's Hidden Resource,
W82-06605 3B

CAVITATION
Cavitation Problems in High-Head Installations (Kavitationsprobleme In Grundablassen).
W82-06237 8B

CAYUGA LAKE
PCB Uptake by Five Species of Fish in Lake Michigan, Green Bay of Lake Michigan, and Cayuga Lake, New York,
W82-06493 5B

CELLULOSE ACETATE
Molecular (Osmotic and Electro-Osmotic) Backwash of Cellulose Acetate Hyperfiltration Membranes,
W82-06792 3A

CELLULOSE ACETATE MEMBRANES
The Development of Dry-RO Membranes from Cellulosis and Noncellulosis Polymers Bearing Quaternary Ammonium Groups,
W82-06152 3A

Cellulose Acetate Membranes for the Reverse Osmosis Treatment of Sewage Effluents. Is Long term Performance a Limiting Factor,
W82-06657 5D

CESIUM-137
Gamma Emitting Fission Products in Surface Sediments of the Ravenglass Estuary,
W82-05984 5B

CESIUM RADIOISOTOPES
Radionuclides in Dardanelle Lake in the Area of the Nuclear I Facility: 1979-1981,
W82-06169 5B

CHANNEL EROSION
Mathematical Model for Erodible Channels,
W82-06336 2J

CHANNEL FLOW
Canals in Sand Channels,
W82-06196 8B

Accuracy Criteria in Diffusion Routing,
W82-06423 8B

Numerical Method of Solving Certain Inverse Problems of Hydraulics,
W82-06619 8B

Numerical Investigations of Plans of Flow in Channels with a Complex Bottom Relief,
W82-06785 8B

CHANNEL IMPROVEMENT
Gowanus Creek Channel; Brooklyn, New York; Review of Reports (Survey); Main Report and Environmental Impact Statement.
W82-06407 6G

CHANNEL MORPHOLOGY
Canals in Sand Channels,
W82-06196 8B

Hydrologic and Morphologic Changes in Channels of the Platte River Basin: A Historical Perspective,
W82-06946 2E

CHANNEL SCOUR
Devon Floods and the Waterways of Bridges,
W82-05948 8A

CHANNEL STABILITY
Evaluation of the Stream Reach Inventory and Channel Stability Index for Instream Habitat Analysis,
W82-06308 4D

CHANNELING
Habitat Recovery in the North Fork of the Teton River.
W82-06409 6G

CHELATION
Multiple Addition Bioassay of Tjeukemeer Water,
W82-06907 5C

CHEMICAL ANALYSIS
The Chemistry and Isotopic Composition of Saline Groundwaters from the Sudbury Basin, Ontario,
W82-05990 2F

Investigation of the Chemical Nature and Possible Toxicity of Products Formed During the Ozone Disinfection of Drinking Water Containing Organic Substances,
W82-06173 5F

Ground Water Quality and Quantity in Fracture Zones in the Piedmont of Northwestern South Carolina,
W82-06309 4B

Trace Metal Relationships at the Sediment-Water Interface,
W82-06362 2K

Metal Surveys in South African Estuaries: II. Knysna Estuary,
W82-06388 2L

Water Quality of the Upper Niagara River, 1975 and 1979,
W82-06576 5A

A 'Dipstick' Sampler for Rapid, Continuous Chemical Profiles in Sediments,
W82-06931 5A

CHEMICAL COMPOSITION
Weak Acid Concentrations and River Chemistry in the Tovdal River, Southern Norway,
W82-06052 2K

Influence and Prevention of Bird-Droppings in Precipitation Chemistry Experiments,
W82-06245 5B

A Study of Selected Great Lakes Coastal Marshes,
W82-06570 5A

CHEMICAL COMPOUNDS
Implications for the Water Industry of the Notification Scheme for New Chemicals,
W82-06261 6E

CHEMICAL INDUSTRY
Estimating Water Demand Schedules for Selected Industries in Arkansas,
W82-06160 6D

Monitoring of Selected Trace Organics During Biological Wastewater Treatment,
W82-06392 5D

CHEMICAL INTERFERENCE
Studies of BOD Inhibition in Presence of Inorganic Heavy Metals,
W82-06436 5C

CHEMICAL OXYGEN DEMAND
Investigations on Loading and Quality of Discharge of Municipal Sewage Treatment Plants in the Case of Stormwater Inflow (Utersuchungen Uber Belastung Und Ablaufbeschaffenheit Kommunaler Klaranlagen Bei Mischwasserzufluss),
W82-06634 5D

Applicability of Light Absorbance as a Measure of Oganic Carbon in Humic Lake Water,
W82-06773 5A

CHEMICAL PRECIPITATION
Beneficial Disposal of Pickle Liquor,
W82-06486 5D

Modern Lacustrine Stromatolites, Walker Lake, Nevada,
W82-06934 5C

CHEMICAL REACTIONS
Investigation of the Chemical Nature and Possible Toxicity of Products Formed During the Ozone Disinfection of Drinking Water Containing Organic Substances,
W82-06173 5F

Sulfate Reduction and Methanogenesis in the Sediment of a Saltmarsh on the East Coast of the United Kingdom,
W82-06541 2L

Recovery of Chromium(VI) from Wastewaters with Iron(III) Hydroxide-I. Adsorption Mechanism of Chromium(VI) on Iron(III) Hydroxide,
W82-06658 5D

UV-Sensitive Complex Phosphorus: Association with Dissolved Humic Material and Iron in a Bog Lake,
W82-06930 5C

CHEMICAL STRATIFICATION
Trace Metal Relationships at the Sediment-Water Interface,
W82-06362 2K

CHEMICAL TREATMENT
Waste Treatment System Retrofitted Within Deadline,
W82-05947 5D

CHEMICAL WASTES
Land Treatment of Industrial Wastes: Principles and Practices. Part II,
W82-06009 5E

Oxidation Products and Rates of Reaction in the Ozonolysis of Diebenzofuran,
W82-06305 5B

Hazardous Material Spills--Are You Ready,
W82-06417 5G

CHEMICAL WASTEWATER
Chemicals and Allied Products,
W82-06805 5D

CHEMISTRY OF PRECIPITATION
Stability of Beta-MnOOH and Manganese Oxide Deposition from Springwater,
W82-06862 2K

CHINA
China's Agro-Ecosystem,
W82-06019 3B

CHLORELLA
Manganese-54 Accumulation by Chlorella SPP., Daphnia Magna and Yellow Perch (Perca Flavescens).
W82-06904 5B

CHLORIDE
Influence of Ozonation on Sulfur, Nitrogen, Chloride and Phosphorus Systems in Public Drinking Water Supplies,
W82-05907 5F

CHLORIDES
Chloride Ion Concentrations as an Aid to Estimating Recharge to the Woburn,
W82-06234 2F

Multiple Potentiometric System for Continuous Determination of Chloride, Fluoride, Nitrate, and Ammonia in Natural Waters,
W82-06718 5A

CHLORINATED HYDROCARBONS
Simple Procedures for Enrichment of Chlorinated Aromatic Pollutants from Fat, Water and Milk for Subsequent Analysis by High-Resolution Methods,
W82-06015 5A

Trihalomethane Formation in Water Treatment Plants in North Carolina,
W82-06158 5F

Organochlorine Residues in Fish from Lake Mjosa in Norway,
W82-06697 5A

The Use of an Alga Chlorella Pyrenoidosa and a Duckweed Lemna Perpusilla as Test Organisms for Toxicity Bioassays of Spent Bleaching Liquors and Their Components,
W82-06721 5C

Separation of Aqueous Organic Mixtures by Pervaporation and Analysis by Mass Spectrometry or a Coupled Gas Chromatograph-Mass Spectrometer,
W82-06791 5A

Purge Aquifer to Remove Volatile Organic Contamination,
W82-06842 5G

CHLORINATIION
A Note on the Effect of Chlorination of Sewage Effluents on Faecal Coliform to Faecal Streptococci Ratios in the Differentiation of Faecal Pollution Sources,
W82-05902 5D

CHLORINATION
Environmental Aspects of Some Alternative Pulp Bleaching Techiques,
W82-05913 5D

Economic Impact Study of R81-11 Trihalomethane Standards for Public Water Supplies,
W82-06098 5F

Trihalomethane Formation in Water Treatment Plants in North Carolina,
W82-06158 5F

Performance of Modified Chlorine Contact Chamber,
W82-06359 5D

Making Chlorination Trustworthy,
W82-06639 5F

A Guide to Treatment for Bacterial Problems,
W82-06847 5F

CHLORINE
The Corrosion of Copper by Chlorinated Drinking Waters,
W82-06051 5F

Chloride Ion Concentrations as an Aid to Estimating Recharge to the Woburn,
W82-06234 2F

Performance of Modified Chlorine Contact Chamber,
W82-06359 5D

Optimum Use of Chlorine in Circulating Water,
W82-06498 5F

Influence of Stabilizer Concentration on Effectiveness of Chlorine as an Algicide,
W82-06539 5F

CHLOROPHENOLS
The Use of an Alga Chlorella Pyrenoidosa and a Duckweed Lemna Perpusilla as Test Organisms for Toxicity Bioassays of Spent Bleaching Liquors and Their Components,
W82-06721 5C

CHLOROPHYLL
The Influence of Phytoplankton Composition on the Relative Effectiveness of Grinding and Sonification for Chlorophyll Extraction,
W82-06902 5A

Effects of Naturally Senescing Aquatic Macrophytes on Nutrient Chemistry and Chlorophyll A of Surrounding Waters,
W82-06943 5C

CHOLESTEROL
Effects of Dissolved Organic Matter on Adsorption of Hydrophobic Organic Compounds by River- and Sewage-Borne Particles,
W82-06056 5B

CHROMATOGRAPHY
Determination of Phosphate in Wastewater by Ion-Exclusion Chromatography with Flow Coulometric Detection,
W82-06040 5A

Determination of Methomyl and Methomyl-Oxime in Fruit Crops and Water by HPLC,
W82-06466 5A

A Rapid High-Performance Liquid-Chromatographic Method for Simultaneously Determining the Concentrations of TFM and Bayer 73 in Water During Lampricide Treatments,
W82-06495 5A

Fractionation of Metal Forms in Natural Waters by Size Exclusion Chromatography with Inductively Coupled Argon Plasma Detection,
W82-06545 5A

Determination of Aldicarb Residues in Water by Combined High Performance Liquid Chromatography Mass Spectrometry,
W82-06549 5A

CHROMIUM
Comparison of the Extractabilities of Zn, Cu, Ni and Cr from Sewage Sludges Prepared by Treating Raw Sewage with the Metal Salts Before or After Anaerobic Digestion,
W82-06079 5D

Summary of Basin and Flood Characteristics for Unregulated Basins in New Mexico,
W82-06671 7C

Flood of August 20, 1979, on a Tributary of Chickamauga Creek, Near Gallipolis, Ohio,
W82-06947 4A

FLORIDA
Soil and Groundwater Changes Under Land Treatment of Wastewater,
W82-05964 5D

Florida Style Water Supply and Treatment,
W82-06027 5F

Hydrogeologic Data from Two Wells at Myakka Head, Manatee County, Florida,
W82-06129 7C

Water Resources of the Ochlockonee River Area, Northwest Florida,
W82-06132 2A

On a Statistical Relationship Between Autumn Rainfall in the Central Equatorial Pacific and Subsequent Winter Precipitation in Florida,
W82-06209 2B

Work Management Standards,
W82-06349 6F

Areal Extent of a Plume of Mineralized Water from a Flowing Artesian Well in Dade County, Florida,
W82-06680 5B

Assessment of Water Quality in Canals of Eastern Broward County, Florida, 1969-74,
W82-06682 5A

Survival of Vibrio Cholerae and Escherichia Coli in Estuarine Waters and Sediments,
W82-06742 5C

Stormwater Management in a Sensitive Area.
W82-06841 5G

Storm Water Runoff Quality From Three Land-Use Areas in South Florida,
W82-06877 5B

Dynamics of a Subtropical Plankton Community, with Emphasis on the Copepod Mesocyclops Edax,
W82-06906 5C

Comparison of Automated Satellite Systems with Conventional Systems for Hydrologic Data Collection in West-Central Florida,
W82-06951 7B

Water Resources Data for Florida, Water Year 1980--Volume 2A. South Florida Surface Water,
W82-06955 7C

Water Resources Data for Florida, Water Year 1980--Volume 2B. South Florida Ground Water,
W82-06956 7C

FLOTATION
Wastewater Reuse Using Microgras Dispersion Stripping,
W82-05911 5D

Copper Removal by an Adsorbing Colloid Foam Flotation Pilot Plant,
W82-05960 5D

Recovery of Fine-Particle Coal by Colloid Flotation,
W82-05961 5D

Removal of Heavy Metals from Aqueous Solutions Using Microgas Dispersions,
W82-05962 5D

Potable Water Treatment by Dissolved Air Flotation and Filtration,
W82-06353 5F

The Removal of Mixtures of Metals by an Adsorbing Colloid Foam Flotation Pilot Plant,
W82-06821 5D

Removal of Zinc by Adsorbing Colloid Foam Flotation: Pilot Plant Study,
W82-06822 5D

FLOW
Finite Element Approximations to Flow Problems,
W82-06730 8B

FLOW AROUND OBJECTS
Turbulent Two-Dimensional Flow of an Incompressible Fluid Around Obstacles with Separation,
W82-06621 8B

FLOW CHANNELS
Lower Flow Regime Bedforms: Rational Classification,
W82-06421 2E

Carrying Capacity of Flood Plains,
W82-06428 2E

FLOW CHARACTERISTICS
A Stochastic Streamflow Model of the Platte River at Overton, Odessa, and Grand Island, Nebraska,
W82-06139 2E

Canals in Sand Channels,
W82-06196 8B

Sewer Network Routing by Dynamic Wave Characteristics,
W82-06418 8B

Numerical Method of Solving Certain Inverse Problems of Hydraulics,
W82-06619 8B

Experimental Investigation of Accelerated Transitional Flow in Pipes,
W82-06786 8B

Floodflow Characteristics of Honcut Creek at State Highway 70 Bridges Near Live Oak, California,
W82-06945 4A

FLOW DEFLECTORS
Hydraulic Model Studies - Yellowtail Afterbay Dam Sluiceway,
W82-06962 8A

FLOW DISCHARGE
Analyzing and Predicting Irrigation Diversions in Southeastern Idaho,
W82-05924 3F

FLOW FRICTION
Lag Time for Diverging Overland Flow,
W82-05944 2A

Turbulent Friction in a Viscous Sublayer and in the Transition Region of the Flow of Water in a Flat Duct,
W82-06468 8B

FLOW PATTERN
Horizontal Recirculation in Water Bodies Due to Thermal Discharge,
W82-06723 5C

Numerical Investigations of Plans of Flow in Channels with a Complex Bottom Relief,
W82-06785 8B

FLOW RATES
A Practical Method of Estimating Peak from Mean Daily Flows With Application to Streams in Ontario,
W82-06568 2E

FLOW REGULATION
The Kielder Water Scheme,
W82-06503 8A

FLOW SEPARATION
Turbulent Two-Dimensional Flow of an Incompressible Fluid Around Obstacles with Separation,
W82-06621 8B

FLOW VELOCITY
Canals in Sand Channels,
W82-06196 8B

Solutions of the Colebrook-White Function for Resistance to Uniform Turbulent Flow,
W82-06501 8B

Hereditary Phenomena in Turbulent Boundary Layers,
W82-06618 8B

FLUID DROPS
On the Graphical Presentation of Raindrop Size Data,
W82-06529 2B

The Effect of Pressure on the Breakup of One Pair of Raindrops,
W82-06761 2B

FLUID FLOW
Finite Element Approximations to Flow Problems,
W82-06730 8B

FLUID MECHANICS
Numerical Methods in Hydraulics,
W82-06614 8B

FLUIDIZED BED PROCESS
Pilot Scale Assessment of the Biological Fluidized Bed Process for Municipal Wastewater Treatment.
W82-06380 5D

FLUIDIZED BEDS
Treatment of Pulp and Paper Industry Wastewaters in an Anaerobic Fluidized Bed Reactor,
W82-06226 5D

The Effect of Backwashing Rate on Filter Performance,
W82-06415 5F

FLUMES
Supercritical Flow Flumes for Measuring Sediment-Laden Flow,
W82-06959 8B

FLUORESCENCE
Determination of the Number of Respiring Thiobacillus Ferrooxidans Cells in Water Samples by Using Combined Fluorescent Antibody-2-(p-Iodophenyl)-3-(p-Nitrophenyl)-5-Phenyltetrazolium Chloride Staining,
W82-06542 5A

FLUORIDES
Settling Characteristics of Flocculent Suspension in Defluoridation of Water by Nalgonda Technique,
W82-06441 5F

Occurrence of Fluoride Bearing Groundwaters and Their Relationship with Water Table Fluctuations,
W82-06443 2K

Multiple Potentiometric System for Continuous Determination of Chloride, Fluoride, Nitrate, and Ammonia in Natural Waters,
W82-06718 5A

FLUOROMETRY
Fluorometric Determination of DNA in Aquatic Microorganisms by Use of Hoechst 33258,
W82-06889 5A

FLUTED TUBES
Hydrodynamics of Condensate Films on Fluted Tube Surfaces. Part I,
W82-06105 3A

Effect of Surface Configuration on Heat Transfer by the Condensation of Steam over Fluted Surfaces. Part II,
W82-06106 3A

FLUVIAL SEDIMENTS
Quantitative Relationships Between Numbers of Fluvial Cycles, Bulk Lithological Composition and Net Subsidence in a Scottish Namurian Basin,
W82-05959 2J

FOAM FLOTATION
Verification of a Model for Foam Flotation Column Operation,
W82-06001 5D

FOAM SEPARATION
Copper Removal by an Adsorbing Colloid Foam Flotation Pilot Plant,
W82-05960 5D

The Removal of Mixtures of Metals by an Adsorbing Colloid Foam Flotation Pilot Plant,
W82-06821 5D

Removal of Zinc by Adsorbing Colloid Foam Flotation: Pilot Plant Study,
W82-06822 5D

FOG
The Potential Acidity Associated with Dews, Frosts, and Fogs,
W82-06246 2K

FOOD-PROCESSING INDUSTRY
Enteric Bacteria in Sugarbeet Refinery Processing Waste Waters,
W82-06195 5D

FOOD-PROCESSING WASTES
Enteric Bacteria in Sugarbeet Refinery Processing Waste Waters,
W82-06195 5D

Wastewater Characterization and Treatment System Development for a Blue Crab Processing Plant,
W82-06306 5D

Anaerobic Filter Treatment of Molasses Distillery Slops,
W82-06312 5D

Comparison of BOD Relationships for Typical Edible and Petroleum Oils.
W82-06458 5D

Potato and Corn By-Products Used as Cattle Feed,
W82-06488 5E

Recycled Food Processing Wastes Reduce Treatment Costs,
W82-06507 3C

Fruit, Vegetable, and Grain Processing Wastes,
W82-06918 5D

Dairy Wastes,
W82-06921 5D

Meat-, Fish-, and Poultry-Processing Wastes,
W82-07000 5D

FOREBAYS
Influence of Dredging and High Discharge on the Ecology of Black Canyon,
W82-06091 6G

FORECASTING
On Predicting the Onset of the Australian Wet Season at Darwin,
W82-06208 2B

A Moisture Analysis Procedure Utilizing Surface and Satellite Data,
W82-06212 2B

One-Dimensional Reservoir-Lake Temperature and Dissolved Oxygen Model,
W82-06687 2H

FOREST MANAGEMENT
The Effects of Acid Rain on Forest Nutrient Status,
W82-06860 5C

Forest Management and Anadromous Fish Habitat Productivity,
W82-06965 5C

FOREST SOILS
Seasonal Variation of Infiltration Capacities of Soils in Western Oregon,
W82-06961 2G

FOREST WATERSHEDS
Variability of Stream Water Quality in Some Land Management Systems in the Southern Kakioka Basin, Japan,
W82-06020 5B

First-Year Effects of Clearcutting an Oak-Hickory Watershed on Water Yield,
W82-06589 4C

Ecology of Streams Draining Forested and Non-Forested Catchments in an Area of Central Scotland Subject to Acid Precipitation,
W82-06909 5C

FORESTRY
New Problems with Upland Waters,
W82-06602 5G

FORESTS
Hydrogen Ion Budget of an Aggrading Forested Ecosystem,
W82-06836 2K

FOULING
Oriented Monolayer Assemblies to Modify Fouling Propensities of Membranes.
W82-06167 3A

Optimum Use of Chlorine in Circulating Water,
W82-06498 5F

FRACTURE PERMEABILITY
Porous Media Equivalents for Networks of Discontinuous Fractures,
W82-06851 2F

FRACTURE TRACES
Ground Water Quality and Quantity in Fracture Zones in the Piedmont of Northwestern South Carolina,
W82-06309 4B

FRACTURE ZONES
Ground Water Quality and Quantity in Fracture Zones in the Piedmont of Northwestern South Carolina,
W82-06309 4B

FRACTURED POROUS MEDIA
An Upstream Finite Element Method for Solution of Transient Transport Equation in Fractured Porous Media,
W82-06858 2F

FRANCE
The Use of Water Quality Objectives in Seine-Normandie,
W82-06254 5G

Sludge Disposal to Sea in France,
W82-06593 5E

French Premiere for Wastewater Disinfection Using Ozone.
W82-06607 5D

FRASER RIVER ESTUARY
Vegetation Structure and Diversity Components of a Fraser Estuary Tidal Marsh,
W82-06465 2L

FREEZE DESALTING
Myths about Freeze Desalting,
W82-06114 3A

LIBRARY U. OF I., URBANA-CHAMPAIGN

Freezing Processes - The Standard of the Future - An Update,
W82-06115 3A

FREEZING
The Importance of Refreezing on the Diurnal Snowmelt Cycle with Application to a Northern Swedish Catchment,
W82-05942 2C

Absorption Freezing Vapor Compression - Process Selection, Pilot Plant Design, Process Economics,
W82-06125 3A

FREQUENCY ANALYSIS
Carrying Capacity for the Illinois River,
W82-05927 6G

Statistical Flood Flow Estimation,
W82-05945 2E

A Method of Estimating Flood-Frequency Parameters for Streams in Idaho,
W82-06142 2E

FREQUENCY DISTRIBUTION
Statistical Flood Flow Estimation,
W82-05945 2E

FRICTION
Qualitative Stability Analysis of Geologic Systems, with an Example from River Hydraulic Geometry,
W82-06717 2E

FROST
The Potential Acidity Associated with Dews, Frosts, and Fogs,
W82-06246 2K

FRUIT CROPS
Wastewater Irrigation of Fruit Trees,
W82-06008 3C

Fruit, Vegetable, and Grain Processing Wastes,
W82-06918 5D

FUEL
The Acute Toxicity of Motor Fuels to Brackish Water Organisms,
W82-05985 5C

FULLER'S METHOD
A Practical Method of Estimating Peak from Mean Daily Flows With Application to Streams in Ontario,
W82-06568 2E

FUNGI
Seasonal Variability and Transport of Suspended Microfungi in a Southeastern Salt Marsh,
W82-06536 2L

Actinomycetes and Fungi in Surface Waters and in Potable Water,
W82-06543 5B

FURROW IRRIGATION
Furrow Intake Rates and Water Management,
W82-05968 3F

Field Evaluation of Furrow Infiltration and Advance Functions,
W82-05969 3F

The Effect of Short-Term Waterlogging During Furrow Irrigation of Cotton in a Cracking Grey Clay,
W82-06010 3F

FUTURE PLANNING
Development of Models for the Planning of Large-Scale Water-Energy Systems,
W82-05915 6A

FUZZY SETS
A Fuzzy Sets Model for Measuring the Effectiveness of Public Participation in Water Resources Planning,
W82-06778 6B

GAMMARUS
Cadmium in Gammaridae (Amphipoda: Crustacea) of the Rivers Werra and Weser-II. Seasonal Variation and Correlation to Temperature and Other Environmental Variables,
W82-06659 5B

GAS CHROMATOGRAPHY
Headspace Chromatographic Determination of Water Pollutants,
W82-06016 5A

Determination of Organochlorines in River Sediment by Capillary Gas Chromatography, Application to Dutch River Sediment,
W82-06274 5A

GASES
Hydraulic Model Studies - Yellowtail Afterbay Dam Sluiceway,
W82-06962 8A

GASTROPODS
Palaeoclimates at Lake Turkana, Kenya, from Oxygen Isotope Ratios of Gastropod Shells,
W82-06216 2D

GATES
Aeration at Floor Offsets in Bottom Outlets (Beluftung an Sohlsprungen Von Grundablassen),
W82-06242 8C

Confluence of Two Jets Created by Two Parallel Segment Gates of a Bottom Outlet (Schussstrahl-Zusammenfuhrung Bei Einem Grundablass Mit Nebeneinyanderliegenden Segmentschutzen).
W82-06243 8B

GEL CHROMATOGRAPHY
Simple Procedures for Enrichment of Chlorinated Aromatic Pollutants from Fat, Water and Milk for Subsequent Analysis by High-Resolution Methods,
W82-06015 5A

GEOCHEMISTRY
Geochemistry of Leachates from Selected Coal Mining and Combustion Wastes,
W82-05936 5B

Some Paleolimnological Aspects of the Most Recent Sediments of Lac Laflamme (Laurentides Provincial Park, Quebec) in Relation to Atmospheric Transportation of Pollutants,
W82-06577 5A

Hydrology of Salt Wells Creek--A Plains Stream in Southwestern Wyoming,
W82-06679 2A

Summary of Hydrologic Testing in Tertiary Limestone Aquifer, Tenneco Offshore Exploratory Well--Atlantic OCS, Lease-Block 427 (Jacksonville NH 17-5),
W82-06685 2F

GEOCHRONOLOGY
Some Paleolimnological Aspects of the Most Recent Sediments of Lac Laflamme (Laurentides Provincial Park, Quebec) in Relation to Atmospheric Transportation of Pollutants,
W82-06577 5A

GEOHYDROLOGY
Daily Operational Tool for Maximum Beneficial Use Management of Surface and Ground Waters in a Basin,
W82-06174 4B

Ground Water in the Piedmont Upland of Central Maryland,
W82-06686 2F

Hydrogeothermal Mapping of the Active Water-Exchange zone in the USSR,
W82-06782 7C

GEOLOGIC FRACTURES
Characterization of Drained and Undrained Response of Thermally Loaded Repository Rocks,
W82-05904 2F

GEOLOGICAL FRACTURES
Lineaments and Fracture Traces, Jennings County and Jefferson Proving Ground, Indiana,
W82-06675 2F

GEOLOGICAL SURVEY
Albedo Survey on Andrei Glacier, Iskut River Basin, B. C., Midsummer, 1980,
W82-06578 2C

GEOLOGY
Development of an Environmental Geology Data Base for Land Use Planning,
W82-06552 6A

GEOMORPHOLOGY
Geomorphic Parameters of Representative Basins and Their Hydrologic Significance,
W82-06384 2A

Fire and Geomorphic Processes,
W82-06963 2J

GEOPHYSIS
Geophysical Reconnaissance of Lemmon Valley, Washoe County, Nevada,
W82-06949 2F

GEORGIA
Effects of Urbanization on Stream Ecosystems,
W82-06165 5C

The Benefits of Pre-Operational Baseline Aquatic Biology Studies,
W82-06235 5A

GEOSTATIONARY METEOROLOGICAL SATELLITE
Estimation of the Precipitable Water from the IR Channel of the Geostationary Satellite,
W82-06995 7B

GEOTHERMAL POWER
Environmental Assessmental, Geothermal Energy, Heber Geothermal Binary-Cycle Demonstration Project; Imperial County, California.
W82-06406 6G

GEOTHERMAL RESOURCES
Environmental Problems and Geothermal Permitting,
W82-06217 6G

Water Law and the Development of Geothermal Resources,
W82-06218 6E

Environmental Assessment; Geothermal Direct Heat Project; Marlin Texas.

GEOTHERMAL STUDIES
Helium Isotopes in Geothermal Systems: Iceland, The Geysers, Raft River and Steamboat Springs,
W82-06085 2F

Hydrogeothermal Mapping of the Active Water-Exchange zone in the USSR,
W82-06782 7C

Data from Geothermal Test Wells Near Mount Hood, Oregon,
W82-06950 7A

GHANA
Epidemiology of Human Schistosoma Haematobium Infection Around Volta Lake, Ghana, 1973-75,
W82-05988 5C

The Role of the Akosombo Dam on the Volta River in Causing Coastal Erosion in Central and Eastern Ghana (West Africa),
W82-06100 2J

Further Observations on the Effect of Abate on Fish Catches,
W82-06722 5C

GLACIAL LAKES
Topologic Model for Drainage Networks with Lakes,
W82-05905 2A

GLACIERS
Albedo Survey on Andrei Glacier, Iskut River Basin, B. C., Midsummer, 1980,
W82-06578 2C

GLACIOLOGY
An Operational Net Shortwave Radiation Model for Glacial Basins,
W82-06064 2C

GOB
Geochemistry of Leachates from Selected Coal Mining and Combustion Wastes,
W82-05936 5B

GOLD
Mercury Contamination of the Lerderderg River, Victoria, Australia, from an Abandoned Gold Field,
W82-06194 5B

GOUNDWATER
Potentiometric Map of the Cockfield Aquifer in Mississippi, Fall 1980,
W82-06676 7C

GOVERNMENT FINANCE
Count on Uncle Sam Less,
W82-05998 6C

GOVERNMENT SUPPORTS
Count on Uncle Sam Less,
W82-05998 6C

GRAPEVINES
Responses of 6-Year-Old Diamond Grapevines to the Change from Sprinkler to Trickle Irrigation and to the Time and Method of Applying Nitrogen,
W82-06492 3F

GRAPHICAL METHODS
Statistical Flood Flow Estimation,
W82-05945 2E

Determination of Reaction Rate Constant and Temperature Coefficient Constant for Dadar Sewage, Bombay,
W82-06438 5D

Turbulent Friction in a Viscous Sublayer and in the Transition Region of the Flow of Water in a Flat Duct,
W82-06468 8B

GRASSES
A Comparison of the Effects of Salinity on Photosynthetic Physiology of a Salt Sensitive Grass, Panicum Obtusum, and a Salt Tolerant Grass, Distichlis Spicata,
W82-06521 3C

GRASSLANDS
Moisture Conservation of Interseeded Grasslands Through the Use of Annual and Perennial Crop Barriers,
W82-06148 3F

GRAVEL
A New Method for Reporting and Interpreting Textural Composition of Spawning Gravel,
W82-06395 8I

GRAVITY DAMS
The Itaipu Hollow Gravity Dam,
W82-06205 8A

Influence of Remedial Measures on the Mohne Gravity Dam (Einfluss Der Sanierungsmassnahmen Auf Die Mohnemauer),
W82-06239 8A

GRAVITY STUDIES
Geophysical Reconnaissance of Lemmon Valley, Washoe County, Nevada,
W82-06949 2F

GREAT BRITAIN
New Problems with Upland Waters,
W82-06602 5G

GREAT DISMAL SWAMP
Methane Flux in the Great Dismal Swamp,
W82-06840 2H

GREAT LAKES
Bioconcentration of a Hexachlorobiphenyl in Great Lakes Planktonic Algae,
W82-05991 5B

Application of X-Ray Microanalysis for the Detection of Heavy Metal in Great Lakes Algae,
W82-05993 5A

Influence of a Hexachlorobiphenyl in Great Lakes Phytoplankton in Continuous Culture,
W82-05994 5C

Physiological and Biochemical Responses of Several Freshwater Algae to a Mixture of Metals,
W82-05996 5C

A Study of Selected Great Lakes Coastal Marshes,

GROUNDWATER POLLUTION

Soil and Groundwater Changes Under Land Treatment of Wastewater,
W82-05964 5D

Groundwater Policy: A Patchwork of Protection,
W82-06411 6E

Groundwater Pollution from Industrial Waste Disposal, A Case Study,
W82-06434 5B

Examination of Probable Causes of Individual Water Supply Contamination,
W82-06435 5B

The Effect of Sewage Sludge Land Disposal on the Microbiological Quality of Groundwater,
W82-06767 5C

A Case Study of a Chemical Spill: Polychlorinated Biphenyls (PCBS). 2. Hydrogeological Conditions and Contaminant Migration,
W82-06866 5B

GROUNDWATER POTENTIAL

Reconnaissance of the Ground-Water Resources of Kings and Queens Counties, New York,
W82-06952 4B

GROUNDWATER PROTECTION

Ground Water Law in Puerto Rico.
W82-06296 6E

GROUNDWATER RECHARGE

Chloride Ion Concentrations as an Aid to Estimating Recharge to the Woburn,
W82-06234 2F

Field Study of Organic Water Quality Changes during Groundwater Recharge in the Palo Alto Baylands,
W82-06831 5B

GROUTING

Influence of Remedial Measures on the Mohne Gravity Dam (Einfluss Der Sanierungsmassnahmen Auf Die Mohnemauer),
W82-06239 8A

GUAM

Diatom Assemblages as Indicators of Water Quality in Freshwater Habitats of Guam,
W82-06146 5A

HAIL

Calculations of Hailstone Growth in a Sloping Steady Updraft,
W82-06526 2B

HARBORS

Physical Process and Eutrophication,
W82-06875 5C

HAWAII

Helium Isotopes in Geothermal Systems: Iceland, The Geysers, Raft River and Steamboat Springs,
W82-06085 2F

Kaneohe Bay Sewage Diversion Experiment: Perspectives on Ecosystem Responses to Nutritional Perturbation,
W82-06846 5G

Hypereutrophication of an Hawaiian Alpine Lake,
W82-06991 5C

HAZARDOUS MATERIALS

Polychlorinated Biphenyls (PCBS): An Australian Viewpoint on a Global Problem,
W82-06232 5B

HEAT EXCHANGER TUBE

Scale Inhibition of Calcium Sulfate by a Fluidized Bed,
W82-06104 3A

HEAT FLOW

Hydrogeothermal Mapping of the Active Water-Exchange zone in the USSR,
W82-06782 7C

HEAT PUMPS

Design of Heat Pump Return Wells,
W82-06294 8C

HEAT TRANSFER

Condensation of Butane Vapor in a Gravity-Drained Ice Bed,
W82-05917 3A

Effect of Surface Configuration on Heat Transfer by the Condensation of Steam over Fluted Surfaces. Part II,
W82-06106 3A

Enhanced Heat Transfer in Horizontal Evaporator-Condensers with Straight-Edged Grooved Tubes,
W82-06108 3A

Heat Transfer in a Rotating Disk Evaporator,
W82-06112 3A

Some Basic Observations on Heat Transfer and Evaporation in the Horizontal Flash Evaporator,
W82-06113 3A

Waste-Heat Vertical Tube Foam Evaporation for Cooling Tower Blowdown Renovation/Recycle,
W82-06369 3E

HEAT TRANSFER COEFFICIENTS
Hydrodynamics of Condensate Films on Fluted Tube Surfaces. Part I,
W82-06105 3A

Transfer Characteristics of Convex and Concave Rivulet Flow on Inclined Surfaces with Straight-Edged Grooves,
W82-06107 3A

HEATED WATER
Experiments on Coaxial Heated Water Discharges,
W82-06422 5B

Thermal Effects,
W82-06809 5C

Multiplication of Legionella Pneumophila in Unsterilized Tap Water,
W82-06881 5C

HEAVY METAL
Removal of Heavy Metals from Electroplating Rinsewaters by Precipitation, Flocculation and Ultrafiltration,
W82-06029 5D

HEAVY METALS
Evaluation of Bacterial Binding and Release of Cadmium from Aquatic Sediments,
W82-05934 5C

Removal of Heavy Metals from Aqueous Solutions Using Microgas Dispersions,
W82-05962 5D

Evaluation of General and Specific Stress Indices in Mussels Collected from Populations Subjected to Different Levels of Heavy Metal Pollution,
W82-05983 5C

Application of X-Ray Microanalysis for the Detection of Heavy Metal in Great Lakes Algae,
W82-05993 5A

Geochemical Factors Controlling the Accumulation and Dispersal of Heavy Metals in the Bay of Fundy Sediments,
W82-06188 2K

Discharge of Metals from the St. Lawrence River,
W82-06190 5B

Effect of Temperature on Heavy Metal Binding by Anaerobically Digested Sludges,
W82-06270 5D

Heavy Metals in Animals of Lake Balaton,
W82-06284 5C

Removal of Zeolite Type A During Primary Sedimentation and Its Effect on Metal Removal,
W82-06338 5D

Antagonism of Selenium and Cadmium Pretreatments to Subsequent Embryotoxic Doses of Mercury and Cadmium in Fish Embryos,
W82-06371 5C

Studies of BOD Inhibition in Presence of Inorganic Heavy Metals,
W82-06436 5C

Impact of Pretreatment on Sludge Content of Heavy Metals,
W82-06461 5D

New High-Performance Analytical Procedure for the Voltammetric Determination of Nickel in Routine Analysis of Water, Biological Materials and Food,
W82-06467 5A

Control of Toxic Metals at Sewage Treatment Works,
W82-06592 5E

Consequences of Contamination by Heavy Metals in Tidal Estuaries by the Example of the River Elbe (Auswirkungen der Schwermetallbelastung von Tidegewassern am Beispiel der Elbe),
W82-06637 5E

Heavy Metals in Sludge--Are Their Toxic Effects Additive,
W82-06646 5E

The Distribution of Heavy Metals in the Bottom Sediments of Three Streams in the Kansas City, Missouri, Metropolitan Area,
W82-06702 5B

Preliminary Study of Thessaloniki Bay for Contamination by Mercury and Lead,
W82-06728 5B

Heavy Metal Pollution in the Chao Phraya River Estuary, Thailand,
W82-06774 5B

Bioaccumulation and Toxicity of Heavy Metals and Related Trace Elements,
W82-06812 5C

HELIUM
Helium Isotopes in Geothermal Systems: Iceland, The Geysers, Raft River and Steamboat Springs,
W82-06085 2F

HERBICIDES
Herbicide Loss in Runoff Water and Sediment as Affected by Center Pivot Irrigation and Tillage Treatments,
W82-05921 5B

Herbicides in Kansas Waters--Evaluations of the Effects of Agricultural Runoff and Aquatic Weed Control on Aquatic Food Chains,
W82-06304 5C

Degradation of Terbutryn in Sediments and Water Under Various Redox Conditions,
W82-06790 5B

HETEROTROPHIC BACTERIA
Correlations Between Predominant Heterotrophic Bacteria and Physicochemical Water Quality Parameters in Two Canadian Rivers,
W82-06544 5B

Methods of Studying Population Shifts in Aquatic Bacteria in Response to Environmental Change,
W82-06558 5C

An Introductory Study of Seasonal Variation in the Aerobic Heterotrophic Bacterial Population of the Saint John River Using Classical Systematics,
W82-06559 5A

An Ecological Approach to the Study of Bacteria at the Florenceville Site in September and February,
W82-06560 5A

Seasonal and Diurnal Changes in the Predominant Heterotrophic Bacterial Species of the Meduxnekeag River,
W82-06562 5A

Diurnal Variations of the Heterotrophic Bacteria in the Sediment and Water of a Small Woodland Stream,
W82-06563 5A

Attached and Free-Floating Bacteria in a Diverse Selection of Water Bodies,
W82-06887 5B

HEXACHLOROBIPHENYL
Bioconcentration of a Hexachlorobiphenyl in Great Lakes Planktonic Algae,
W82-05991 5B

Influence of a Hexachlorobiphenyl in Great Lakes Phytoplankton in Continuous Culture,
W82-05994 5C

HIGH-HEAD INSTALLATIONS
Cavitation Problems in High-Head Installations (Kavitationsprobleme In Grundablassen).
W82-06237 8B

HIGH PERFORMANCE LIQUID CHROMATOGRAPHY
Determination of Methomyl and Methomyl-Oxime in Fruit Crops and Water by HPLC,
W82-06466 5A

Determination of Aldicarb Residues in Water by Combined High Performance Liquid Chromatography Mass Spectrometry,
W82-06549 5A

HIGH-VELOCITY JETS
Aeration at Floor Offsets in Bottom Outlets (Beluftung an Sohlsprungen Von Grundablassen),
W82-06242 8C

HIGH WATER MARK
Statistical Search for High Water at Board Landing Bridge, Truro, Nova Scotia,
W82-06394 2L

HIGHWAY RELOCATION
Erosion Control at a Delicate Highway Construction Site,
W82-06510 4D

HOLLOW CONSTRUCTION DAMS
The Itaipu Hollow Gravity Dam,
W82-06205 8A

HONG KONG
Factors Affecting the Distribution of Lignicolous Marine Fungi in Hong Kong,
W82-06908 5B

HOOVER DAM
Evaluation of Possible Temperature Fluctuations from Proposed Power Modifications of Hoover Dam,
W82-06092 6G

HUDSON RIVER
Production and Vertical Flux of Attached Bacteria in the Hudson River of the New York Bight as Studied with Floating Sediment Traps,
W82-06736 5C

HUMAN DISEASE
Isolation of Pittsburgh Pneumonia Agent from a Hospital Shower,
W82-06891 5B

HUMAN DISEASES
Epidemiology of Human Schistosoma Haematobium Infection Around Volta Lake, Ghana, 1973-75.
W82-05988 5C

Malignant Melanoma and Drinking Water Contamination,
W82-05989 5C

Viruses in a Community Water Supply Associated with an Outbreak of Gastroenteritis and Infectious Hepatitis,
W82-06348 5C

LIBRARY U. OF I., URBANA-CHAMPAIGN

Disease Outbreaks Caused by Drinking Water,
W82-06928 5C

HUMIC ACIDS
Removal of Humic Substances from Natural Waters by Reverse Osmosis,
W82-06045 5F

The Effect of Metal Ions on the Ultraviolet Spectra of Humic Acid, Tannic Acid and Lignosulfonic Acid,
W82-06273 2K

Applicability of Light Absorbance as a Measure of Oganic Carbon in Humic Lake Water,
W82-06773 5A

UV-Sensitive Complex Phosphorus: Association with Dissolved Humic Material and Iron in a Bog Lake,
W82-06930 5C

HUMID AREAS
An Economic Comparison of the Irrigation of Corn in Humid and Arid Regions of the United States,
W82-05909 6B

HUMIDITY
Autocorrelations of Moisture Parameters on Isentropic Surfaces,
W82-06210 2B

HUNGARY
Heavy Metals in Animals of Lake Balaton,
W82-06284 5C

Complex Sequence Treats Fluctuating Flows,
W82-06814 5F

HYDRAULIC DESIGN
Bicycle-Safe Grate Inlets Study; Volume 5 - Hydraulic Design of General Slotted Drain Inlets,
W82-06095 8B

Optimal Risk-Based Hydraulic Design of Bridges,
W82-06432 8A

HYDRAULIC ENGINEERING
Practical Calculations and Recommendations on the Use of Gunpowder Rock Breakers in Hydrotechnical Construction,
W82-06086 8H

Planned Measures for Water Regulation Constructing the New Munich Airport (Geplante Wasserwirtschaftliche Massnahmen Beim Bau des Neuen Flughafens fur Munchen),
W82-06825 8A

HYDRAULIC EQUIPMENT
Practical Calculations and Recommendations on the Use of Gunpowder Rock Breakers in Hydrotechnical Construction,
W82-06086 8H

Flow Control at Stormwater Overflows and Stormwater Tanks (Abflusssteuerung von Regenwasserbehandlungsanlagen),
W82-06633 8C

HYDRAULIC GEOMETRY
Qualitative Stability Analysis of Geologic Systems, with an Example from River Hydraulic Geometry,
W82-06717 2E

HYDRAULIC JUMP
Hydraulic Jump, Air Entrainment and Slug Flow in Bottom Outlets (Wechselsprung, Lufteintrag Und Schwallformiger Abfluss in Grundablassen),
W82-06244 8B

HYDRAULIC MODELS
Effects of Reduced Stream Discharge on Fish and Aquatic Macroinvertebrate Populations,
W82-05923 6G

Bicycle-Safe Grate Inlets Study; Volume 5 - Hydraulic Design of General Slotted Drain Inlets,
W82-06095 8B

Dissolved Oxygen Modelling of the St. Croix River, Maine - New Brunswick,
W82-06572 5B

Hydraulic Model Studies - Yellowtail Afterbay Dam Sluiceway,
W82-06962 8A

HYDRAULIC PROPERTIES
On Conducting the Modified 'Slug' Test in Tight Formations,
W82-06060 8B

Practical Calculations and Recommendations on the Use of Gunpowder Rock Breakers in Hydrotechnical Construction,
W82-06086 8H

Evaluation of the Water Resources Potential of the Lower Missouri River Valley Alluvium,
W82-06696 6B

HYDRAULICS
Canals in Sand Channels,
W82-06196 8B

Solutions of the Colebrook-White Function for Resistance to Uniform Turbulent Flow,
W82-06501 8B

Numerical Methods in Hydraulics,
W82-06614 8B

Hydraulic Analysis, Paint Creek at State Route 772, Chillicothe, Ohio,
W82-06948 8B

HYDROCARBONS
Petroleum Processing Wastes,
W82-06801 5D

HYDROCHLORIC ACID
Beneficial Disposal of Pickle Liquor,
W82-06486 5D

HYDRODYNAMICS
Mathematical Models for Calculating the Dynamics and Quality of Complex Water Systems,
W82-06613 2A

HYDROELECTRIC PLANTS
Planning Sri Lanka's Victoria Scheme,
W82-05979 8A

Resonant Waterhammer: A Case Study,
W82-05981 8C

Application Procedures for Hydropower Licenses, Exemptions and Preliminary Permits.
W82-06088 6E

Simulating and Improving Hydro Plant Control,
W82-06202 8C

The Itaipu Hollow Gravity Dam,
W82-06205 8A

Reregulation on an International River--A Case Study,
W82-06429 6G

HYDROELECTRIC POWER
Hydroelectric Power Offers Stable, Cheap Energy Source for Industry,
W82-05954 6B

The Energy Resources of Kenya,
W82-05978 6D

Small Scale Hydroelectric Development and Federal Environmental Law: A Guide for the Private Developer,
W82-06002 6E

Competition Between Irrigation and Hydropower Water Use in Washington State,
W82-06156 6A

Organizational and Political Considerations in the Municipal Development of Small Hydropower,
W82-06588 6E

HYDROGEN ION CONCENTRATION
Effects of pH, Temperature, and eH on the Uptake of Cadmium by Bacteria and an Artificial Sediment,
W82-06580 5B

Recovery of Protein and Oil from Fishery Bloodwater Waste, Effect of pH and Temperature,
W82-06655 5D

Effects of Acid on Plant Litter Decompostion in an Arctic,
W82-06737 5C

Hydrogen Ion Budget of an Aggrading Forested Ecosystem,
W82-06836 2K

HYDROGEN SULFIDE
Hydrogen Sulfide Corrosion of the Baghdad Trunk Sewerage System,
W82-06651 5C

HYDROGRAPHS
A Discrete System Storage Model for Analyzing Rainfall-Runoff Relationships,
W82-06219 2A

Comparing Urban Runoff Models,
W82-06447 2A

HYDROLOGIC ASPECTS
Manual of Engineering of Irrigated Lands (Manual de Ingenieria de Regadios), Vol. 1.
W82-06375 3F

Manual of Engineering of Irrigated Lands (Manual de Ingenieria de Regadios), Vol. 2,
W82-06376 3F

HYDROLOGIC BUDGET
Regional Water Balance on the Arctic Tundra in Summer,
W82-06061 2D

A Salt and Water Balance Model for Silt Loam Soil Cropped to Rice and Soybean,
W82-06172 2G

Truckee Meadows Water Use - Present and Future,
W82-06705 3D

HYDROLOGIC CYCLE
Hydrology of Salt Wells Creek--A Plains Stream in Southwestern Wyoming,

The Removal of Mixtures of Metals by an Adsorbing Colloid Foam Flotation Pilot Plant,
W82-06821 5D

Removal of Zinc by Adsorbing Colloid Foam Flotation: Pilot Plant Study,
W82-06822 5D

Effect of Artificial Destratification on Iron, Manganese, and Zinc in the Water, Sediments, and two Species of Benthic Macroinvertebrates in an Oklahoma Lake,
W82-06897 5G

METAMORPHIC ROCKS

Ground Water Quality and Quantity in Fracture Zones in the Piedmont of Northwestern South Carolina,
W82-06309 4B

METHANE

Methanogenesis in Big Soda Lake, Nevada: An Alkaline, Moderately Hypersaline Desert Lake,
W82-06535 2H

Methane Flux in the Great Dismal Swamp,
W82-06840 2H

METHANE BACTERIA

Immobilized Microbes and a High-Rate, Continuous Waste Processor for the Production of High Btu Gas and the Reduction of Pollutants,
W82-06005 5D

Kinetic Analysis of Competition Between Sulfate Reducers and Methanogens for Hydrogen in Sediments,
W82-06886 2H

METHANOGENESIS

Methanogenesis in Big Soda Lake, Nevada: An Alkaline, Moderately Hypersaline Desert Lake,
W82-06535 2H

Sulfate Reduction and Methanogenesis in the Sediment of a Saltmarsh on the East Coast of the United Kingdom,
W82-06541 2L

METHOMYL

Determination of Methomyl and Methomyl-Oxime in Fruit Crops and Water by HPLC,
W82-06466 5A

METHYLMERCURY

Proportion of Methylmercury to the Total Amount of Mercury in River Waters in Canada and Japan,
W82-06609 5B

METROSTAT

Estimation of Runoff-Producing Precipitation with the Aid of Satellite Imagery (Ermittlung Abflusswirksamer Niederschlage Aus Satellitendaten),
W82-06823 2B

MICHIGAN

Intermediary Metabolism of Organic Matter in the Sediments of a Eutrophic Lake,
W82-06745 5C

Kinetic Analysis of Competition Between Sulfate Reducers and Methanogens for Hydrogen in Sediments,
W82-06886 2H

Comparative Aspects of Sulfur Mineralization in Sediments of a Eutrophic Lake Basin,
W82-06888 5C

MICROBIAL DEGRADATION

Developing an ATP Index for Degradation of Drinking Water Quality by Attached Microbes,
W82-05932 5F

Determination of Reaction Rate Constant and Temperature Coefficient Constant for Dadar Sewage, Bombay,
W82-06438 5D

Biotransformation of PCB by Natural Assemblages of Freshwater Microorganisms,
W82-06719 5B

MICROBIOLOGICAL STUDIES

Factors Affecting Flog Formation and Bulking in the Activated Sludge Process for Treatment of Textile Waste Waters,
W82-06171 5D

Influence of Salinity and Organic Nutrient Concentration on Survival and Growth of Vibrio Cholerae in Aquatic Microcosms,
W82-06534 5C

Determination of the Number of Respiring Thiobacillus Ferrooxidans Cells in Water Samples by Using Combined Fluorescent Antibody-2-(p-Iodophenyl)-3-(p-Nitrophenyl)-5-Phenyltetrazolium Chloride Staining,
W82-06542 5A

Microbial Dynamics of an Epilithic Mat Community in a High Alpine Stream,
W82-06729 2E

Dye-Coupled Electrode System for the Rapid Determination of Cell Populations in Polluted Water,
W82-06743 5A

Development of a Method for Detection of Human Rotavirus in Water and Sewage,
W82-06885 5A

Microbiology: Methodology and Quality Assurance,
W82-06919 5A

Microbiology: Water,
W82-06924 5B

Microbiology: Wastewater Treatment,
W82-06926 5D

Microbiology: Detection, Occurrence and Removal of Viruses,
W82-06927 5B

Comparative Photoheterotrophy, Chemoheterotrophy, and Photolithotrophy in a Eutrophic Reservoir and an Oligotrophic Lake,
W82-06978 2H

MICROENVIRONMENT

Substrate-Associated Microfauna,
W82-06925 5C

MICROGAS DISPERSIONS

Removal of Heavy Metals from Aqueous Solutions Using Microgas Dispersions,
W82-05962 5D

Water Reuse by Metal Removal from Industrial Plating Effluents,
W82-06307 5D

MICROINVERTEBRATES

A Faunal Analysis of the Springs off the Ouachita Mountains, Arkansas,
W82-06161 2K

MICROORGANISMS

Scanning Electron Microscope Evaluation of Rotating Biological Contactor Biofilm,
W82-06047 5D

A Method for Monitoring Mineralization of 14C-Labeled Compounds in Aqueous Samples,
W82-06272 5A

Mineralization of Detrital Lignocelluloses by Salt Marsh Sediment Microflora,
W82-06410 2L

Ultraviolet Systems in Water Treatment,
W82-06726 5F

Differential Phosphorus Assimilation in Attached vs. Unattached Microorganisms,
W82-06762 5B

Improved Method for Determination of Respiring Individual Microorganisms in Natural Waters,
W82-06883 5A

MICROPROCESSORS
Microprocessors and Computers in Analysis in the Water Industry,
W82-06259 5F

Modelling of the Activated Sludge Process for Microprocessor-Based State Estimation and Control,
W82-06324 5D

MICROSCOPIC ANALYSIS
Scanning Electron Microscope Evaluation of Rotating Biological Contactor Biofilm,
W82-06047 5D

Diatom Assemblages as Indicators of Water Quality in Freshwater Habitats of Guam,
W82-06146 5A

MICROSCOPY
Improved Method for Determination of Respiring Individual Microorganisms in Natural Waters,
W82-06883 5A

MIDGES
Transport of PCBs in Aquatic Laboratory Model Ecosystems from Sediment to the Atmosphere Via the Surface Microlayer,
W82-06180 5B

Observations on the Immature Chironomidea of Polluted Lowland Brook-Pond System (Antwerp, Belgium), Aerated by the Phallus Process,
W82-06912 5G

MINE DRAINAGE
Biological Processes for Concentrating Trace Elements from Uranium Mine Waters,
W82-06520 5D

Thermodynamic Controls on Quality of Water from Underground Coal Mines in Colorado,
W82-06624 5G

Coal and Coal Mine Drainage,
W82-06802 5B

MINE WASTES
Geochemistry of Leachates from Selected Coal Mining and Combustion Wastes,
W82-05936 5B

Recovery of Fine-Particle Coal by Colloid Flotation,
W82-05961 5D

Mercury Contamination of the Lerderderg River, Victoria, Australia, from an Abandoned Gold Field,
W82-06194 5B

Biological Processes for Concentrating Trace Elements from Uranium Mine Waters,
W82-06520 5D

Coal and Coal Mine Drainage,
W82-06802 5B

Preliminary Studies on the Dewatering of Coal-Clay Waste Slurries Using a Flocculant,
W82-06958 5D

Electrokinetic Densification of Solids in a Coal Mine Sediment Pond- A Feasibililty Study, (In Two Parts), 1. Laboratory and Field Tests,
W82-06960 5D

MINERALIZATION
A Method for Monitoring Mineralization of 14C-Labeled Compounds in Aqueous Samples,
W82-06272 5A

Rates of Mineralization of Trace Concentrations of Aromatic Compounds in Lake Water and Sewage Samples,
W82-06738 5B

Kinetics and Extent of Mineralization of Organic Chemicals at Trace Levels in Freshwater and Sewage,
W82-06756 5B

Comparative Aspects of Sulfur Mineralization in Sediments of a Eutrophic Lake Basin,
W82-06888 5C

MINERALS
Mineral Law Since Nepa,
W82-06582 6E

MINNESOTA
Waste Treatment System Retrofitted Within Deadline,
W82-05947 5D

Supplying Water to the Rural Community,
W82-06223 5F

Seasonal Variation of Nitrogen and Phosphorus Species in the Red River,
W82-06573 5B

Water Quality of Alimagnet, Farquar, and Long Lakes in Apple Valley, Minnesota,
W82-06690 2H

Survival of Escherichia Coli in Lake Bottom Sediment,
W82-06741 5B

MISSISSIPPI
Potentiometric Map of the Sparta Aquifer System in Mississippi, Fall 1980,
W82-06135 7C

Water-Level Map of the Mississippi Delta Alluvium in Northwestern Mississippi, April 1981,
W82-06138 7C

Potentiometric Map of the Cockfield Aquifer in Mississippi, Fall 1980,
W82-06676 7C

MISSISSIPPI RIVER
Waves Generated by River and Wind on the Illinois and Mississippi Rivers,
W82-06163 2J

MISSOURI
Identification of Atypical Coliforms from Public Water Supplies in Missouri,
W82-05935 5A

Geochemistry of Leachates from Selected Coal Mining and Combustion Wastes,
W82-05936 5B

Sediment Analyses for Urbanizing Watersheds,
W82-06426 2J

The Distribution of Heavy Metals in the Bottom Sediments of Three Streams in the Kansas City, Missouri, Metropolitan Area,
W82-06702 5B

Simplified Clarifier Axes Treatment Stages,
W82-06820 5D

MISSOURI RIVER
Evaluation of the Water Resources Potential of the Lower Missouri River Valley Alluvium,
W82-06696 6B

MIXING
Destratification of Lakes and Reservoirs to Improve Water Quality,
W82-06385 5G

Experiments on Coaxial Heated Water Discharges,
W82-06422 5B

Variability of Temperature, Salinity and Tidally-Averaged Density in the Middle Estuary of the St. Lawrence,
W82-06533 2L

MODEL STUDIES
Kinetics of Compressibility in Two-Phase Fluid Flows,
W82-05910 1A

Finite Element Modeling of Streamflow Routing,
W82-05918 2E

Effects of Reduced Stream Discharge on Fish and Aquatic Macroinvertebrate Populations,
W82-05923 6G

Climate Variation and the Mobility and Storage of Sediment in Watersheds,
W82-05931 4D

Investigations of Dispersal in an Area of Complex Circulation - The Outer Thames Estuary,
W82-05946 5B

Verification of a Model for Foam Flotation Column Operation,
W82-06001 5D

Recent Advances in Assessing Impact of Phosphorus Loads on Eutrophication-Related Water Quality,
W82-06034 5C

Sensible Energy Storage in Aquifers. 2. Field Experiments and Comparison with Theoretical Results,
W82-06058 4B

An Operational Net Shortwave Radiation Model for Glacial Basins,
W82-06064 2C

A Stochastic Streamflow Model of the Platte River at Overton, Odessa, and Grand Island, Nebraska,
W82-06139 2E

Competition Between Irrigation and Hydropower Water Use in Washington State,
W82-06156 6A

Reliability Analysis of BOD Kinetics in a Southern Stream Governed by the Discharge of an Oxidation Pond,
W82-06159 5B

Size and Shape in Raised Mire Ecosystems: A Geophysical Model,
W82-06215 2G

Investigation of the Overflow Spillway of the Velishchai Reservoir,
W82-06220 8A

Choice of Space and Time Steps in the Muskingum-Cunge Flood Routing Method,
W82-06227 4A

Modelling of the Activated Sludge Process for Microprocessor-Based State Estimation and Control,
W82-06324 5D

Acid Rain Model: Hydrologic Module,
W82-06360 5B

Geomorphic Parameters of Representative Basins and Their Hydrologic Significance,
W82-06384 2A

Reservoir Systems Optimization,
W82-06433 4A

Comparing Urban Runoff Models,
W82-06447 2A

Circulation Patterns; Their Investigation and Prediction,
W82-06477 5F

Inshore-Offshore Sedimentation Differences Resulting from Resuspension in the Eastern Basin of Lake Erie,
W82-06494 2J

A Two-Dimensional, Finite Element Model of Salt Water Intrusion in Groundwater Systems,
W82-06525 4B

Mathematical Models for Calculating the Dynamics and Quality of Complex Water Systems,
W82-06613 2A

Institutional Aspects Affecting Management of Groundwater in California,
W82-06700 6B

Horizontal Recirculation in Water Bodies Due to Thermal Discharge,
W82-06723 5C

A Fuzzy Sets Model for Measuring the Effectiveness of Public Participation in Water Resources Planning,
W82-06778 6B

Subsurface Drainage Effects on Erosion,
W82-06795 4D

Light Adaptation and Inhibition: Processes Important in Modelling the Growth of Algae in Drinking Water Basins,
W82-06827 5C

A Statistical-Dynamical Climate Model with a Simple Hydrology Cycle,
W82-06838 2B

Comparison of Techniques for Estimating Annual Lake Evaporation Using Climatological Data,
W82-06850 2D

Porous Media Equivalents for Networks of Discontinuous Fractures,
W82-06851 2F

A Kinematic Model for Surface Irrigation: An Extension,
W82-06852 3F

Real-Time, Statistically Linearized, Adaptive Flood Routing,
W82-06855 4A

Moisture and Heat Transport in Hysteretic, Inhomogeneous Porous Media: A Matric Head-Based Formulation and a Numerical Model,
W82-06857 2G

Identification of Aquifer Transmissivities: The Comparison Model Method,
W82-06859 2F

Application of SCS Infiltration Model,
W82-06872 4D

A Dynamic System Model for Simulating Sediment Discharge,
W82-06876 4D

Ecological Studies and Mathematical Modeling of Cladophora in Lake Huron: I. Program Description and Field Monitoring of Growth Dynamics,
W82-06939 5C

Ecological Studies and Mathematical Modeling of Cladophora in Lake Huron: 2. Phosphorus Uptake Kinetics,
W82-06940 5C

Systems Analysis,
W82-06997 5G

MODEL TESTING

Finite Element Modeling of Streamflow Routing,
W82-05918 2E

Evaluation of Models and Procedures Used for River Operations and Planning in the Upper Snake and Boise Rivers in Idaho,
W82-05925 4A

MOISTURE

Autocorrelations of Moisture Parameters on Isentropic Surfaces,
W82-06210 2B

A Moisture Analysis Procedure Utilizing Surface and Satellite Data,
W82-06212 2B

MOLECULAR BACKWASH

Molecular (Osmotic and Electro-Osmotic) Backwash of Cellulose Acetate Hyperfiltration Membranes,
W82-06792 3A

MOLYBDENUM

Biological Processes for Concentrating Trace Elements from Uranium Mine Waters,
W82-06520 5D

MONETARY BENEFITS

Feasibility of Financial Incentives to Reuse Low Quality Waters in the Colorado River Basin,
W82-06693 3C

MONITORING

Evaluation of General and Specific Stress Indices in Mussels Collected from Populations Subjected to Different Levels of Heavy Metal Pollution,
W82-05983 5C

Peripheral Effects of Cadmium on the Blood and Head Kidney in the Brown Bullhead (Ictalurus Nebulosus),
W82-06003 5C

Continuous Monitoring of Cyanide Concentration in Surface Water (Kontinuierliche Uberwachung Der Cyanid-Konzentration in Oberflachenwasser),
W82-06023 5A

A Method for Monitoring Mineralization of 14C-Labeled Compounds in Aqueous Samples,
W82-06272 5A

Monitoring of Selected Trace Organics During Biological Wastewater Treatment,
W82-06392 5D

Portable Water Elevation Measuring Gage,
W82-06396 7B

A Microprocessor-Based Controller for the Plugging Factor Monitor,
W82-06398 3A

The Practical Handling of Water Quality Monitoring Data,
W82-06591 7C

Making Chlorination Trustworthy,
W82-06639 5F

Multiple Potentiometric System for Continuous Determination of Chloride, Fluoride, Nitrate, and Ammonia in Natural Waters,
W82-06718 5A

Locating Monitoring Wells,
W82-06848 8B

Ecological Studies and Mathematical Modeling of Cladophora in Lake Huron: I. Program Description and Field Monitoring of Growth Dynamics,
W82-06939 5C

MONOMOLECULAR FILMS

Oriented Monolayer Assemblies to Modify Fouling Propensities of Membranes.
W82-06167 3A

MONTANA

Hydraulic Model Studies - Yellowtail Afterbay Dam Sluiceway,
W82-06962 8A

MONTE CARLO METHOD

Calculating Consent Conditions to Achieve River Quality Objectives,
W82-06725 5G

MOUNT ST HELENS

Management of Watershed Rehabilitation-- Reflections from Mt. St. Helens and Redwood Creek,
W82-06968 4D

Preliminary Post-Eruption Sediment Budget for the North Fork Toutle River Drainage, June 1980-May 1981,
W82-06970 4D

Sediment Influx to the Toutle River from Erosion of Tephra, May 1980-May 1981,
W82-06971 4D

MOUNTAIN BASINS

Biogeochemistry of Mountain Stream Waters: The Marmot System,
W82-06569 5B

MOUNTAINS

Dispersion in Mountainous Natural Streams,
W82-06357 2E

Calibrating A Mountain Watershed in Wyoming,
W82-06583 2E

MT ST HELENS

Impact of Mount St. Helens Eruption on Bacteriology of Lakes in the Blast Zone,
W82-06746 5C

MULTI-FLASH DISTILLATION

Analysis of Large Desalination Plants,
W82-06122 3A

MULTIOBJECTIVE PLANNING

A Multiobjective Branch-and-Bound Method for Planning Wastewater and Residual Management Systems,
W82-06149 6A

MULTIPHASE FLOW

Kinetics of Compressibility in Two-Phase Fluid Flows,
W82-05910 1A

MULTIPURPOSE PROJECTS

Reservoir Planning for Brazilian Dams,
W82-06206 6A

MULTIPURPOSE RESERVOIRS

Construction Criteria of the Mery-Sur-Oise Storage Basin - Improvements in Water Quality Obtained,
W82-06013 5G

LIBRARY U. OF I., URBANA-CHAMPAIGN

MULTIRESERVOIR NETWORKS
TVA Hydro Scheduling Model: Theoretical Aspects,
W82-06430 4A

TVA Hydro Scheduling Model: Practical Aspects,
W82-06431 4A

MULTISTAGE FLASH DISTILLATION
RO, MSF and VTE/VC Desalination: A Comparative Evaluation,
W82-06110 3A

MSF Desalination Plants, Availability, Reliability and Safety Analysis,
W82-06124 3A

MULTIVARIATE ANALYSIS
Generation of Weekly Streamflow Data for a Large Hydrological System-An Autoregressive Multivariate Multi-Lag-Model(Simulation Wochentlicher Abflusse fur Ein Grossraumiges Hydrologisches System-Ein Autoregressives, Multivariates Multi-Lag-Modell-),
W82-06826 4A

MUNICIPAL WASTEWATER
Energy Conservation in Municipal Wastewater Plants,
W82-06070 5D

Evaluation of Biological Nitrification - Denitrification at Penticton, British Columbia,
W82-06379 5D

Pilot Scale Assessment of the Biological Fluidized Bed Process for Municipal Wastewater Treatment.
W82-06380 5D

Application of Ultraviolet Disinfection in a Tertiary Wastewater Treatment Plant,
W82-06390 5D

Investigations on Loading and Quality of Discharge of Municipal Sewage Treatment Plants in the Case of Stormwater Inflow (Utersuchungen Uber Belastung Und Ablaufbeschaffenheit Kommunaler Klaranlagen Bei Mischwasserzufluss),
W82-06634 5D

Influence of Multicellular Configurations on Algal Growth in Aerated Lagoons,
W82-06662 5D

MUNICIPAL WATER
Municipal and Industrial Water Demands of Western U.S.,
W82-06463 6D

Evaluation of Demand Management Policies for Conserving Water in Urban Outdoor Residential Uses,
W82-06669 3D

MUSKINGUM-CUNGE MODEL
Choice of Space and Time Steps in the Muskingum-Cunge Flood Routing Method,
W82-06227 4A

MUSSELS
Evaluation of General and Specific Stress Indices in Mussels Collected from Populations Subjected to Different Levels of Heavy Metal Pollution,
W82-05983 5C

MUTAGENIC ACTIVITY
Mutagenic Activity of Fish and Sediments in the Sheep River, Alberta,
W82-06770 5C

MUTAGENS
Organic Constituents of Mutagenic Secondary Effluents from Wastewater Treatment Plants,
W82-06178 5D

On the Detection of Mutagenic/Carcinogenic Activities in Water with the Salmonella/Microsome Test (Ames Test)(Zum Nachweis Mutagener/Kanzerogener Aktivitaten in Wassern mit dem Salmonella/Mikrosomen-Test (Ames-Test)),
W82-06715 5A

MYRIOPHYLLUM
Phosphorus Release by Submerged Macrophytes: Significance to Epiphyton and Phytoplankton,
W82-06977 5B

NALGONDA TECHNIQUE
Settling Characteristics of Flocculent Suspension in Defluoridation of Water by Nalgonda Technique,
W82-06441 5F

NATIONAL FLOOD INSURANCE PROGRAM
Managing Flood Risk: Technical Uncertainty in the National Flood Insurance Program,
W82-06073 6F

NATURAL GAS
A Survey of Discharges from a Natural Gas Drilling Operation in Lake Erie,
W82-06720 5B

NATURAL RECHARGE
Infiltration Rates of Rainwaters in Sri Lanka Measured by Using Tritium Tracer,
W82-05941 2F

Chloride Ion Concentrations as an Aid to Estimating Recharge to the Woburn,
W82-06234 2F

NATURAL WATERS
Comparison of Filtration Techniques for Size Distribution in Freshwaters,
W82-06731 5A

Stability of Beta-MnOOH and Manganese Oxide Deposition from Springwater,
W82-06862 2K

Stable Carbon Isotope Ratio of Submerged Freshwater Macrophytes,
W82-06972 5C

NAVIER-STOKES EQUATION
Hydrodynamics of Condensate Films on Fluted Tube Surfaces. Part I,
W82-06105 3A

NAVIGATION
Evaluating Inland Waterway Navigation Improvement Projects: The Case of the Bonneville Lock,
W82-06869 6B

NEBRASKA
A Stochastic Streamflow Model of the Platte River at Overton, Odessa, and Grand Island, Nebraska,
W82-06139 2E

Who Owns Nebraska's Ground Water,
W82-06819 6E

NET RADIATION
An Operational Net Shortwave Radiation Model for Glacial Basins,
W82-06064 2C

Potential Evaporation in the Peace Region of British Columbia,
W82-06528 2D

NETHERLANDS
Water Quality and Hydrology in a Coastal Region of the Netherlands,
W82-06103 5B

Influence and Prevention of Bird-Droppings in Precipitation Chemistry Experiments,
W82-06245 5B

Determination of Organochlorines in River Sediment by Capillary Gas Chromatography, Application to Dutch River Sediment,
W82-06274 5A

NETWORK DESIGN
Water Distribution Network Analysis Using Interactive Graphics,
W82-06453 5F

NETWORKS
Topologic Model for Drainage Networks with Lakes,
W82-05905 2A

NEUTRALIZATION
Carbon-Dioxide Neutralization of an Alkaline Effluent,
W82-05973 5D

NEVADA
Evaluation of Impacts Associated with Reregulation of Water Levels in Lake Mohave,
W82-06089 6G

Methanogenesis in Big Soda Lake, Nevada: An Alkaline, Moderately Hypersaline Desert Lake,
W82-06535 2H

Artificial Recharge of Colorado River Water in Las Vegas Valley: Management Options and Potential Aquifer System Responses,
W82-06694 6B

Truckee Meadows Water Use - Present and Future,
W82-06705 3D

Modern Lacustrine Stromatolites, Walker Lake, Nevada,
W82-06934 5C

Geophysical Reconnaissance of Lemmon Valley, Washoe County, Nevada,
W82-06949 2F

NEW BRUNSWICK
Methods of Studying Population Shifts in Aquatic Bacteria in Response to Environmental Change,
W82-06558 5C

An Introductory Study of Seasonal Variation in the Aerobic Heterotrophic Bacterial Population of the Saint John River Using Classical Systematics,
W82-06559 5A

An Ecological Approach to the Study of Bacteria at the Florenceville Site in September and February,
W82-06560 5A

Seasonal and Diurnal Changes in the Predominant Heterotrophic Bacterial Species of the Meduxnekeag River,
W82-06562 5A

Interactions of Heterotrophic Bacteria in the Sediment Water Phases of Two Contrasting Rivers,
W82-06564 5A

Dissolved Oxygen Modelling of the St. Croix River, Maine - New Brunswick,
W82-06572 5B

NEW HAMPSHIRE
Hydrogen Ion Budget of an Aggrading Forested Ecosystem,
W82-06836 2K

NEW JERSEY
Overhauling a Water System,
W82-06224 5F

Effect of Temperature on Heavy Metal Binding by Anaerobically Digested Sludges,

NEW MEXICO
Feed from Sewage: Prospects and Constraints,
W82-06489 5E

The Benefits of Water Management in Energy and Agricultural Development in the San Juan River Basin of New Mexico,
W82-06517 3E

Summary of Basin and Flood Characteristics for Unregulated Basins in New Mexico,
W82-06671 7C

NEW YORK
Hydrogeologic Data from Selected Wells and Test Holes in Suffolk County, Long Island, New York, 1972-80,
W82-06131 7C

Gowanus Creek Channel; Brooklyn, New York; Review of Reports (Survey); Main Report and Environmental Impact Statement.
W82-06407 6G

Landspreading of sludge in New York State,
W82-06557 5E

Rates of Mineralization of Trace Concentrations of Aromatic Compounds in Lake Water and Sewage Samples,
W82-06738 5B

Reconnaissance of the Ground-Water Resources of Kings and Queens Counties, New York,
W82-06952 4B

NEW YORK BIGHT
Production and Vertical Flux of Attached Bacteria in the Hudson River of the New York Bight as Studied with Floating Sediment Traps,
W82-06736 5C

NEW YORK CITY
Leak Location Enters Computer Age,
W82-06018 7A

NEW ZEALAND
Factors Influencing Orthophospate Turnover Times: A Comparision of Canadian and New Zealand Lakes,
W82-05992 2H

NICKEL
Comparison of the Extractabilities of Zn, Cu, Ni and Cr from Sewage Sludges Prepared by Treating Raw Sewage with the Metal Salts Before or After Anaerobic Digestion,
W82-06079 5D

New High-Performance Analytical Procedure for the Voltammetric Determination of Nickel in Routine Analysis of Water, Biological Materials and Food,
W82-06467 5A

Heavy Metals in Sludge--Are Their Toxic Effects Additive,
W82-06646 5E

The Effect of Increased Nickel Ion Concentrations on Microbial Populations in the Anaerobic Digestion of Sewage Sludge,
W82-06832 5D

NILE DELTA
Changes in Bottom Topography of the Western Shelf on the Nile Delta Since 1922,
W82-06094 2J

NILE RIVER
Review of Treaties on Consumptive Utilization of Waters of Lake Victoria and Nile Drainage System,
W82-05987 6E

NITRATE
Diatom Distribution and Status of Organic Pollution in Sewage Drains,
W82-06484 5C

NITRATES
Effect of Nitrate Concentration in Lake Water on Phosphate Release from the Sediment,
W82-06313 5C

Multiple Potentiometric System for Continuous Determination of Chloride, Fluoride, Nitrate, and Ammonia in Natural Waters,
W82-06718 5A

Denitrification, Nitrate Reduction, and Oxygen Consumption in Coastal and Estuarine Sediments,
W82-06748 5C

NITRIFICATION
Nitrogen Removal in Continuous-Flow Sequentially Aereated Activated Sludge Systems,
W82-05950 5D

Nitrification Kinetics and Its RBC Application,
W82-06356 5D

Evaluation of Biological Nitrification - Denitrification at Penticton, British Columbia,
W82-06379 5D

50 Years of Lake Baldeney - Some Aspects of Its Characteristics in Terms of Water Management (50 Jahre Baldeneysee - Einige Aspekte Seiner Wasserwirtschaftlichen Besonderheiten),
W82-06716 5G

Investigations into the Nitrification of Sydney's Wastewaters,
W82-06724 5D

Apparent and Measured Rate of Nitrification in the Hypolimnion of a Mesotrophic Lake,
W82-06749 5C

Effects of Polychlorinated Biphenyls and Environmental Bio-Transformation Products on Aquatic Nitrification,
W82-06753 5C

Use of Nitrifier Activity Measurements to Estimate the Efficiency of Viable Nitrifier Counts in Soils and Sediments,
W82-06755 5A

NITRILOTRIACETIC ACID
The Influence of Transient Temperature Changes on the Biodegradation of Nitrilotriacetic Acid in the Activated Sludge Process,
W82-06193 5D

The Behaviour of Nitrilotriacetic Acid During the Anaerobic Digestion of Sewage Sludge,
W82-06667 5D

NITROGEN
Influence of Ozonation on Sulfur, Nitrogen, Chloride and Phosphorus Systems in Public Drinking Water Supplies,
W82-05907 5F

Nutrient Control of Blue-Green Algae in a Southwestern Reservoir,
W82-05912 5C

Effect of Irrigation Frequency and Nitrogen on Groundnut Yield and Nutrient Uptake,
W82-06230 3F

An Automated Procedure for the Determination of Total Kjeldahl Nitrogen,

RIVER BASIN DEVELOPMENT
Multiobjective River Basin Planning with Qualitative Criteria,
W82-06062 6A

RIVER BASINS
Combining Site-Specific and Regional Information: An Empirical Bayes Approach,
W82-05903 2A

Feasibility of Financial Incentives to Reuse Low Quality Waters in the Colorado River Basin,
W82-06693 3C

RIVER BEDS
Low Cost Filtration Plants for Water Supply of Ardha-Kumbha Mela, 1980 at Hardwar,
W82-06437 5F

RIVER FLOW
Variability of the DNEPR Runoff Under the Effect of Economic Activities,
W82-06983 4C

RIVER REGULATIONS
Calculating Consent Conditions to Achieve River Quality Objectives,
W82-06725 5G

Ecological Principles of the Creation of an Optimal Water Regime in the Volga Delta and North Caspian Sea,
W82-06985 6G

RIVERS
Evaluation of Models and Procedures Used for River Operations and Planning in the Upper Snake and Boise Rivers in Idaho,
W82-05925 4A

Mineralogical Input of Suspended Matter by Indian Rivers into the Adjacent Areas of the Indian Ocean,
W82-06102 2J

Discharge of Metals from the St. Lawrence River,
W82-06190 5B

Immediate and Delayed Oxygen Depletion in Rivers,
W82-06269 5G

Nomographs for Rapid Solutions for the Streeter-Phelps Equations,
W82-06460 5B

Fact Finding Hearing - Cottonwood Creek Instream Beneficial Use Program,
W82-06522 6B

ROAD CONSTRUCTION
Cold Regions Engineering in Norway,
W82-06000 8A

ROADS
Quality of Stormwater Runoff from Motorways (Diebeschaffenheit der Niederschlagsabflusse von Autobahnen),
W82-06635 5B

The Challenge of Upgrading Roadside Rest Areas,
W82-06845 5G

ROCK EXCAVATION
Practical Calculations and Recommendations on the Use of Gunpowder Rock Breakers in Hydrotechnical Construction,
W82-06086 8H

ROCK MECHANICS
Characterization of Drained and Undrained Response of Thermally Loaded Repository Rocks,
W82-05904 2F

On Conducting the Modified 'Slug' Test in Tight Formations,
W82-06060 8B

ROCKFILL DAMS
The Grosse Dhunn Dam and the Facilities for the Control of Stability and Functioning (Die Grosse Dhunn-Talsperre Und Die Messeinrichtungen Zur Uberwachung Der Standsicherheit Und Der Funktionstuchtigkeit Des Dammes),
W82-06240 8D

Test and Control Programme for Twiste Dam Situated in Sandstone and with Restricted Extent of Sub-Surface Sealing (Mess- und Uberwachungsprogramm Einer Stauanlage im Buntsandstein bei Begrenzter Untergrundabdichtung am Beispiel der Twistetalsperre),
W82-06632 8D

ROOT ZONE
Comparison of Methods ot Estimate Deep Percolation Rates,
W82-06867 2G

ROTATING BIOLOGICAL CONTACTOR
Rotating Biological Contactor Scale-Up and Design,
W82-06344 5D

Rotating Biological Contactor System Design,
W82-06355 5D

Nitrification Kinetics and Its RBC Application,
W82-06356 5D

ROTATING BIOLOGICAL CONTACTORS
Scanning Electron Microscope Evaluation of Rotating Biological Contactor Biofilm,
W82-06047 5D

Performance of Rotating Biological Contactors Under Field Conditions,
W82-06650 5D

ROUGHNESS COEFFICIENT
Numerical Method of Solving Certain Inverse Problems of Hydraulics,
W82-06619 8B

Numerical Investigations of Plans of Flow in Channels with a Complex Bottom Relief,
W82-06785 8B

ROUTING
Finite Element Modeling of Streamflow Routing,
W82-05918 2E

Sewer Network Routing by Dynamic Wave Characteristics,
W82-06418 8B

RUHR RIVER
Continuous Monitoring of Cyanide Concentration in Surface Water (Kontinuierliche Uberwachung Der Cyanid-Konzentration in Oberflachenwasser),
W82-06023 5A

Development of Wastewater Purification in the Ruhr Catchment Area and its Effects on Water Quality in the 1970's (Entwicklung Der Abwasserreinigung Im Ruhr Einzugsgebiet Und Ihre Auswirkungen Auf Die Gewassergute In Den Siebzieger Jahren),
W82-06469 5D

RUNOFF
Estimation of Runoff-Producing Precipitation with the Aid of Satellite Imagery (Ermittlung Abflusswirksamer Niederschlage Aus Satellitendaten),
W82-06823 2B

Computation of Runoff Reduction Caused by Farm Ponds,
W82-06874 4A

Storm Water Runoff Quality From Three Land-Use Areas in South Florida,
W82-06877 5B

RUNOFF COEFFICIENT
Sensitivity of SCS Models to Curve Number Variation,
W82-06631 2A

RUNOFF COEFFICIENTS
A Remote Sensing Technique for Estimating Watershed Runoff,
W82-06151 7C

RUNOFF FORECASTING
Evaluation of Models and Procedures Used for River Operations and Planning in the Upper Snake and Boise Rivers in Idaho,
W82-05925 4A

RUNOFF VALUE
Evaporation from the Surface of the Arctic Tundra on Axel Heiberg Island,
W82-06065 2D

RUNOFF VOLUME
Nonpoint Source Loading Rates from Selected Land Uses,
W82-06626 5B

Reduction of Urban Runoff Through Economic Incentives: Boulder, Colorado,
W82-06629 4C

RURAL AREAS
Appropriate Selection of Water/Wastewater Treatment Processes for Small Cities and Rural Areas,
W82-06162 5D

Supplying Water to the Rural Community,
W82-06223 5F

RUTLAND WATER
Introduction - Rutland Water 1970-1981,
W82-06482 6B

SAFE YIELD
An Optimization Algorithm in a System for Management of the Regional Safe Groundwater Yield,
W82-06616 4B

SAFETY
Safety Aspects in the Design and Inspection of Dams,
W82-06203 8A

Safety of Dams (Sicherheit Von Talsperren),
W82-06236 8A

Components for a Treatment Plant Safety Program,
W82-06992 5G

SAINT JOHN RIVER
Methods of Studying Population Shifts in Aquatic Bacteria in Response to Environmental Change,
W82-06558 5C

LIBRARY U. OF I., URBANA-CHAMPAIGN

An Introductory Study of Seasonal Variation in the Aerobic Heterotrophic Bacterial Population of the Saint John River Using Classical Systematics,
W82-06559 5A

An Ecological Approach to the Study of Bacteria at the Florenceville Site in September and February,
W82-06560 5A

SALINE-FRESHWATER INTERFACES
A Two-Dimensional, Finite Element Model of Salt Water Intrusion in Groundwater Systems,
W82-06525 4B

SALINE LAKES
Methanogenesis in Big Soda Lake, Nevada: An Alkaline, Moderately Hypersaline Desert Lake,
W82-06535 2H

SALINE SOILS
Geomorphic and Lithologic Controls of Diffuse-Source Salinity, Grand Valley, Western Colorado,
W82-06364 2J

A Comparison of the Effects of Salinity on Photosynthetic Physiology of a Salt Sensitive Grass, Panicum Obtusum, and a Salt Tolerant Grass, Distichlis Spicata,
W82-06521 3C

Infiltration Capacity Curves for Sodium Affected Soils,
W82-06712 3C

SALINE WATER
Two-Phase Flow Thermosiphoning for Evaporator Application,
W82-05916 3A

Characterization of Laverkin Springs Water and Methods for Its Reuse in Energy Development,
W82-06400 5G

A Comparison of the Effects of Salinity on Photosynthetic Physiology of a Salt Sensitive Grass, Panicum Obtusum, and a Salt Tolerant Grass, Distichlis Spicata,
W82-06521 3C

Feasibility of Financial Incentives to Reuse Low Quality Waters in the Colorado River Basin,
W82-06693 3C

SALINE WATER INTRUSION
Water Quality and Hydrology in a Coastal Region of the Netherlands,
W82-06103 5B

A Two-Dimensional, Finite Element Model of Salt Water Intrusion in Groundwater Systems,
W82-06525 4B

Areal Extent of a Plume of Mineralized Water from a Flowing Artesian Well in Dade County, Florida,
W82-06680 5B

Stormwater Management in a Sensitive Area.
W82-06841 5G

Saltwater Encroachment in an Aquifer: A Case Study,
W82-06864 2F

The Distribution of Aquatic Oligochaetes in Brackish Inland Waters in the SW Netherlands,
W82-06905 5B

SALINITY
Salt Uptake in Natural Channels Traversing Mancos Shales in the Price Basin, Utah,
W82-06093 2E

Geomorphic and Lithologic Controls of Diffuse-Source Salinity, Grand Valley, Western Colorado,
W82-06364 2J

Vegetation-Environment Relations in a Brackish Marsh, Lulu Island, Richmond, B.C.,
W82-06497 2L

A Comparison of the Effects of Salinity on Photosynthetic Physiology of a Salt Sensitive Grass, Panicum Obtusum, and a Salt Tolerant Grass, Distichlis Spicata,
W82-06521 3C

Variability of Temperature, Salinity and Tidally-Averaged Density in the Middle Estuary of the St. Lawrence,
W82-06533 2L

A Model for Managing Irrigated Agriculture,
W82-06584 5G

York River Destratification: An Estuary-Subestuary Interaction,
W82-06787 2L

SALMON
Effects of Suspended Volcanic Sediment on Coho and Chinook Salmon in the Toutle and Cowlitz Rivers,
W82-06706 5C

SALT BALANCE
A Salt and Water Balance Model for Silt Loam Soil Cropped to Rice and Soybean,
W82-06172 2G

SALT MARSHES
The Ecology of New England High Salt Marshes: A Community Profile,
W82-06096 2L

Mineralization of Detrital Lignocelluloses by Salt Marsh Sediment Microflora,
W82-06410 2L

Seasonal Variability and Transport of Suspended Microfungi in a Southeastern Salt Marsh,
W82-06536 2L

Sulfate Reduction and Methanogenesis in the Sediment of a Saltmarsh on the East Coast of the United Kingdom,
W82-06541 2L

Mechanisms for Trace Metal Enrichment at the Surface Microlayer in an Estuarine Salt Marsh,
W82-06975 5A

SALT RIVER BASIN
Salt Uptake in Natural Channels Traversing Mancos Shales in the Price Basin, Utah,
W82-06093 2E

SALT TOLERANCE
Salt- and Drought-Tolerant Crop Plants for Water Conservation,
W82-05920 3C

A Comparison of the Effects of Salinity on Photosynthetic Physiology of a Salt Sensitive Grass, Panicum Obtusum, and a Salt Tolerant Grass, Distichlis Spicata,
W82-06521 3C

SALT UPTAKE
Salt Uptake in Natural Channels Traversing Mancos Shales in the Price Basin, Utah,
W82-06093 2E

SAMPLE PREPARATION
The Influence of Phytoplankton Composition on the Relative Effectiveness of Grinding and Sonification for Chlorophyll Extraction,
W82-06902 5A

SAMPLE PRESERVATION
Changes in Extractable Metal Concentrations During Storage of Surface Water Samples Containing Sediments,
W82-06630 2K

Right Place, Time and Technique: Right Sample,
W82-06642 5A

SAMPLING
The Relative Abundance of Opossum Shrimp, Mysis Relicta, in Twin Lakes, Colorado Using a Benthic Trawl,
W82-06399 6G

Evaluation of a System to Automatically Sample Zooplankton from the Discharge of Dams,
W82-06628 5A

Right Place, Time and Technique: Right Sample,
W82-06642 5A

Sampling Characteristics of Macrophyte Biomass,
W82-06779 5A

Reservoir Water Quality Sampling Design,
W82-06868 2H

Sampling Design and Enumeration Statistics for Bacteria Extracted from Marine Sediments,
W82-06884 5A

A 'Dipstick' Sampler for Rapid, Continuous Chemical Profiles in Sediments,
W82-06931 5A

SAND
Laboratory Investigation of Deformations of Canals in Sand,
W82-06990 8B

SAND FILTERS
UV Disinfection for Onsite Sand Filter Effluent,
W82-05937 5D

SANDSTONES
Test and Control Programme for Twiste Dam Situated in Sandstone and with Restricted Extent of Sub-Surface Sealing (Mess- und Uberwachungsprogramm Einer Stauanlage im Buntsandstein bei Begrenzter Untergrundabdichtung am Beispiel der Twistetalsperre),
W82-06632 8D

SANITARY ENGINEERING
Cost of Wash Houses and Comfort Stations at Recreation Areas,
W82-06042 6C

SANITARY ENGINEERING *COST ANALYSIS
Evaluation of Biological Nitrification - Denitrification at Penticton, British Columbia,
W82-06379 5D

SANITATION
They Don't Activate Their Sludge in Lagos or Lahore,
W82-06075 5F

SASKATCHEWAN
Seasonal Variation of Nitrogen and Phosphorus Species in the Red River,
W82-06573 5B

A Case Study of a Chemical Soil: Polychlorinated Biphenyls (PCBS) 1. History, Distribution, and Surface Translocation,
W82-06865 5B

SATELLITE TECHNOLOGY
Tropical Cyclone Rainfall Characteristics as Determined from a Satellite Passive Microwave Radiometer,
W82-06214 2B

Optimizing the Evaluation of Lake Water Quality Through Analysis of Existing Remotely Sensed Data,
W82-06370 7C

Estimation of Runoff-Producing Precipitation with the Aid of Satellite Imagery (Ermittlung Abflusswirksamer Niederschlage Aus Satellitendaten),
W82-06823 2B

SAUDI ARABIA
Material Specification and the Availability and Life of Desalination Equipment in Both Saudia Arabia and the Arabian Gulf,
W82-06126 3A

SAVANNAH RIVER PLANT
Final Environmental Impact Statement; Defense Waste Processing Facility, Savannah River Plant, Aiken, S.C.
W82-06087 6G

SCALE FORMATION
Morphology of Inhibitor-Treated CaCo3 Precipitate,
W82-06120 3A

SCALE INHIBITION
Scale Inhibition of Calcium Sulfate by a Fluidized Bed,
W82-06104 3A

SCALING
Morphology of Inhibitor-Treated CaCo3 Precipitate,
W82-06120 3A

SCIENTIFIC PERSONNEL
Laboratory Services in Regional Water Authorities,
W82-06256 5G

SCOTLAND
Bed-Material Size and the Riffle-Pool Sequence,
W82-05958 2J

Quantitative Relationships Between Numbers of Fluvial Cycles, Bulk Lithological Composition and Net Subsidence in a Scottish Namurian Basin,
W82-05959 2J

Discharge to the North Sea,
W82-06248 5E

Ecology of Streams Draining Forested and Non-Forested Catchments in an Area of Central Scotland Subject to Acid Precipitation,
W82-06909 5C

SEALANTS
Security Aspects at the Design and Construction of Sealing for Dams (Sicherheitsaspekte Bei Konstruktion Und Ausfuhrung Von Dammidichtungen),
W82-06241 8G

SEALING
Test and Control Programme for Twiste Dam Situated in Sandstone and with Restricted Extent of Sub-Surface Sealing (Mess- und Uberwachungsprogramm Einer Stauanlage im Buntsandstein bei Begrenzter Untergrundabdichtung am Beispiel der Twistetalsperre),
W82-06632 8D

Application of Ozone to Eliminate Tertiary Treatment of Wastewater Used for Industrial Cooling,
W82-06709 5F

SEASONAL RATIOS
Seasonal Variation of Nitrogen and Phosphorus Species in the Red River,
W82-06573 5B

SEASONAL VARIATION
Climate Variation and the Mobility and Storage of Sediment in Watersheds,
W82-05931 4D

Weak Acid Concentrations and River Chemistry in the Tovdal River, Southern Norway,
W82-06052 2K

Stochastic Trigger Model for Flood Peaks 1. Development of the Model,
W82-06325 2E

Seasonal Variability and Transport of Suspended Microfungi in a Southeastern Salt Marsh,
W82-06536 2L

Seasonal and Long-Term Changes in Surface Cover of Aquatic Plants in a Shallow Pond, Ojaga-Ike, Chiba, Japan,
W82-06900 5C

Dynamics of a Subtropical Plankton Community, with Emphasis on the Copepod Mesocyclops Edax,
W82-06906 5C

Seasonal Variation of Infiltration Capacities of Soils in Western Oregon,
W82-06961 2G

SEASONAL VARIATIONS
Seasonal and Diurnal Changes in the Predominant Heterotrophic Bacterial Species of the Meduxnekeag River,
W82-06562 5A

Cadmium in Gammaridae (Amphipoda: Crustacea) of the Rivers Werra and Weser-II. Seasonal Variation and Correlation to Temperature and Other Environmental Variables,
W82-06659 5B

Annual Variations in Abundance of Zooplankton in Lake Valencia (Venezuela),
W82-06765 5C

SECCHI DISKS
Secchi Disc Relationships,
W82-06627 2H

SECONDARY WASTEWATER
Organic Constituents of Mutagenic Secondary Effluents from Wastewater Treatment Plants,
W82-06178 5D

Microstrainer Theory and the Filtrability Index of Sewage Effluents,
W82-06647 5D

SECONDARY WASTEWATER TREATMENT
Economic Impact Analysis of Combined Sewer Overflow Regulations on East St. Louis, R81-12
W82-06099 5G

SEDIMENT
Primary Productivity and Nutrients in the Sediment Retention Basin of Lake Monroe,
W82-06470 5C

SEDIMENT CONTROL
Evaluating Sediment Blankets and a Screen for Macrophyte Control in Lakes,
W82-06097 4A

Lake Restoration by Sediment Removal,
W82-06776 5G

SEDIMENT DISCHARGE
A Dynamic System Model for Simulating Sediment Discharge,
W82-06876 4D

SEDIMENT EROSION
Preliminary Post-Eruption Sediment Budget for the North Fork Toutle River Drainage, June 1980-May 1981,
W82-06970 4D

Sediment Influx to the Toutle River from Erosion of Tephra, May 1980-May 1981,
W82-06971 4D

SEDIMENT LOAD
Supercritical Flow Flumes for Measuring Sediment-Laden Flow,
W82-06959 8B

SEDIMENT SAMPLER
A New Method for Reporting and Interpreting Textural Composition of Spawning Gravel,
W82-06395 8I

SEDIMENT TRANSPORT
Transport of Iron, Manganese, Cadmium, Copper, and Zinc by Magela Creek, Northern Territory, Australia,
W82-06054 5B

Mineralogical Input of Suspended Matter by Indian Rivers into the Adjacent Areas of the Indian Ocean,
W82-06102 2J

Origin of Step-Pool Systems in Mountain Streams,
W82-06335 2J

Geomorphic and Lithologic Controls of Diffuse-Source Salinity, Grand Valley, Western Colorado,
W82-06364 2J

Sediment Transport and Unit Stream Power Function,
W82-06424 2J

Inshore-Offshore Sedimentation Differences Resulting from Resuspension in the Eastern Basin of Lake Erie,
W82-06494 2J

Suspended Sediment in a Wave Field,
W82-06527 2J

Sediment Transport Study Along a Delta Shoreline,
W82-06553 2J

Use of the Finite-Element Method for Solving the Transfer Equation,
W82-06620 2J

Preliminary Post-Eruption Sediment Budget for the North Fork Toutle River Drainage, June 1980-May 1981,
W82-06970 4D

Laboratory Investigation of Deformations of Canals in Sand,
W82-06990 8B

SEDIMENT-WATER INTERFACES
Sediment-Water Interactions of Cu, Zn, and Pb Discharged from a Domestic Waste Water Source into a Bay of Lough Neagh, Northern Ireland,
W82-06080 5B

Transport of PCBs in Aquatic Laboratory Model Ecosystems from Sediment to the Atmosphere Via the Surface Microlayer,
W82-06180 5B

Trace Metal Relationships at the Sediment-Water Interface,
W82-06362 2K

Metal Surveys in South African Estuaries: III. Hartenbos, Little Brak and Great Brak Rivers,
W82-06387 5B

SEDIMENT YIELD
Climate Variation and the Mobility and Storage of Sediment in Watersheds,
W82-05931 4D

LIBRARY U. OF I., URBANA-CHAMPAIGN

Fire and Geomorphic Processes,
W82-06963 2J

SEDIMENTARY BASINS
Quantitative Relationships Between Numbers of Fluvial Cycles, Bulk Lithological Composition and Net Subsidence in a Scottish Namurian Basin,
W82-05959 2J

SEDIMENTATION
Depositional Model for a Chenier Plain, Gulf of Carpentaria, Australia,
W82-05957 2J

Sediment Character and Provenance in a Complex Fjord; Howe Sound, British Columbia,
W82-06189 2J

Effects of Turbulent Suspension on Trajectories of Settling Particles,
W82-06289 5E

Physical-Chemical Treatment and Disinfection of Stormwater,
W82-06389 5G

Sediment Analyses for Urbanizing Watersheds,
W82-06426 2J

Erosion and Sediment,
W82-06554 2J

Calculation of Cumulative Percentage at Selected Particle Sizes from Bottom Withdrawal Tube Analysis,
W82-06873 2J

SEDIMENTATION RATES
Inshore-Offshore Sedimentation Differences Resulting from Resuspension in the Eastern Basin of Lake Erie,
W82-06494 2J

Sedimentary Losses of Phosphorus in some Natural and Artificial Iowa Lakes,
W82-06901 5C

SEDIMENTOLOGY
Palaeoclimates at Lake Turkana, Kenya, from Oxygen Isotope Ratios of Gastropod Shells,
W82-06216 2D

SEDIMENTS
Geochemical Factors Controlling the Accumulation and Dispersal of Heavy Metals in the Bay of Fundy Sediments,
W82-06188 2K

Criteria for the Use of Regression Analysis for Remote Sensing of Sediment and Pollutants,
W82-06233 7C

Trace Metal Relationships at the Sediment-Water Interface,
W82-06362 2K

Effect of Sulfide on Nitrogen Fixation in a Stream Sediment-Water System,
W82-06540 5C

National Interlaboratory Quality Control Study No 27, PCBs, in Naturally Contaminated Dry Sediments,
W82-06574 5B

National Interlabratory Quality Control Study No 25, PCBs in Wet Sediments,
W82-06575 5A

Some Paleolimnological Aspects of the Most Recent Sediments of Lac Laflamme (Laurentides Provincial Park, Quebec) in Relation to Atmospheric Transportation of Pollutants,
W82-06577 5A

Effects of pH, Temperature, and eH on the Uptake of Cadmium by Bacteria and an Artificial Sediment,
W82-06580 5B

The Distribution of Heavy Metals in the Bottom Sediments of Three Streams in the Kansas City, Missouri, Metropolitan Area,
W82-06702 5B

Denitrification, Nitrate Reduction, and Oxygen Consumption in Coastal and Estuarine Sediments,
W82-06748 5C

Use of Nitrifier Activity Measurements to Estimate the Efficiency of Viable Nitrifier Counts in Soils and Sediments,
W82-06755 5A

Mutagenic Activity of Fish and Sediments in the Sheep River, Alberta,
W82-06770 5C

Invironmental Significance of Pesticide Residues Associated with Aquatic Sediments,
W82-06789 5C

Degradation of Terbutryn in Sediments and Water Under Various Redox Conditions,
W82-06790 5B

Aquatic Sediments,
W82-06806 2J

Sampling Design and Enumeration Statistics for Bacteria Extracted from Marine Sediments,
W82-06884 5A

A 'Dipstick' Sampler for Rapid, Continuous Chemical Profiles in Sediments,
W82-06931 5A

Change in Composition of Organic Matter in the Tama and The Ara River Sediments by Pollution, (In Japanese),
W82-06974 5A

SEEPAGE
Calculations of the Capacity of Water Intakes with Consideration of Groundwater Leakage Through Steeply Dipping, Poorly Permeable Deposits,
W82-06617 2F

SEEPAGE CONTROL
The Value of Inspection Galleries,
W82-06204 8D

SEICHES
Vertical Movements of the Surface Water and Thermal Stratification in Rutland Water,
W82-06476 2H

Free Surface Oscillations in Lake Kinneret,
W82-06879 2H

SELENIUM
Antagonism of Selenium and Cadmium Pretreatments to Subsequent Embryotoxic Doses of Mercury and Cadmium in Fish Embryos,
W82-06371 5C

Biological Processes for Concentrating Trace Elements from Uranium Mine Waters,
W82-06520 5D

SELF-PURIFICATION
Comparative Characteristics of the Bacterioplankton of Rivers,
W82-06986 5C

Effect of Phytoplankton on Water Quality in the Northern Donets-Donbas Canal,
W82-06987 5C

SEMIARID LANDS
Effects of Irrigation Frequency on Germination and on Root and Shoot Yields of Acacia Species,
W82-06229 2I

Synthesis of Streamflow Information Relating to the Semi-Arid Karoo Biome of South Africa,
W82-06835 4A

SENSITIVITY ANALYSIS
Ames Salmonella Mutagenicity Assays on Water: Dichloromethane Extracts Versus Preparation of Growth Media with Test Samples,
W82-06548 5A

Sensitivity of SCS Models to Curve Number Variation,
W82-06631 2A

SEPARATION TECHNIQUES
Extraction of Phenolic Compounds and Organic Acids by Liquid Membranes,
W82-06331 5D

Membrane Separation Processes,
W82-06445 5D

Apparatus for Cleaning Water Containing Foreign Particles Such as Suspended Matters or Oil,
W82-06699 5D

The Removal of Mixtures of Metals by an Adsorbing Colloid Foam Flotation Pilot Plant,
W82-06821 5D

Removal of Zinc by Adsorbing Colloid Foam Flotation: Pilot Plant Study,
W82-06822 5D

The Electrolytic Process for Chromate Removal in Cooling Towers,
W82-06996 5D

SEPTIC TANKS
Put Pressure on Sewage,
W82-06732 5D

SESTON
A Comparison of Different Phosphorus Fractions as Predictors of Particulate Pigment Levels in Lake Memphremagog and Its Tributaries,
W82-06496 5C

SETTLING BASINS
Settling Characteristics of Flocculent Suspension in Defluoridation of Water by Nalgonda Technique,
W82-06441 5F

Primary Productivity and Nutrients in the Sediment Retention Basin of Lake Monroe,
W82-06470 5C

SETTLING TANKS
Plant Expansion Via High-Rate Pretreatment,
W82-05953 5F

Presedimentation Tanks for High Turbid Raw Water,
W82-06444 5F

M B Settler: A More Economical Alternative to Conventional Settler,
W82-06446 5F

SEWAGE
Diatom Distribution and Status of Organic Pollution in Sewage Drains,
W82-06484 5C

Feed from Sewage: Prospects and Constraints,
W82-06489 5E

SEWAGE BACTERIA
A Note on the Effect of Chlorination of Sewage Effluents on Faecal Coliform to Faecal Strepto-

cocci Ratios in the Differentiation of Faecal Pollution Sources,
W82-05902 5D

Application of Ultraviolet Disinfection in a Tertiary Wastewater Treatment Plant,
W82-06390 5D

SEWAR SYSTEMS
Put Pressure on Sewage,
W82-06732 5D

SEWER HYDRAULICS
Sewer Network Routing by Dynamic Wave Characteristics,
W82-06418 8B

SEWER SYSTEMS
A Legacy from Construction Grants,
W82-06251 5D

Sewer Maintenance and Rehab Options,
W82-06253 5D

Sewerage: Priorities for Action,
W82-06260 8G

The Application of Microcomputers to the Design of Storm Sewer Systems for Small Areas,
W82-06449 8A

Major Factors in Sewer Ventilation,
W82-06462 8A

Standard Practice for Insertion of Flexible Polyethylene Pipe into Existing Sewers--ASTM F585-78.
W82-06601 8A

Out of Sight--Out of Mind.
W82-06713 8A

Sewer Renewal by Pipe Insertion.
W82-06759 8A

Watertight Manholes Cut Inflow.
W82-06844 5G

SHENANGO RIVER
Federal Water Pollution Control Act's Notice Requirement Liberally Construed,
W82-05986 6E

SHOCK LOADS
Bacteria Solve Problems Created by Prisoners.
W82-06505 5D

SHRIMP
The Relative Abundance of Opossum Shrimp, Mysis Relicta, in Twin Lakes, Colorado Using a Benthic Trawl,
W82-06399 6G

Colorado Cooperative Fishery Research Unit Studies at Twin Lakes, Colorado: 1980 Report of Findings,
W82-06402 6G

SILTING
Modification of Benthic Insect Communities in Polluted Streams: Combined Effects of Sedimentation and Nutrient Enrichment,
W82-06903 5C

SIMULATION
Robust Flood Frequency Models,
W82-06319 2E

SIMULATION ANALYSIS
A Stochastic Streamflow Model of the Platte River at Overton, Odessa, and Grand Island, Nebraska,
W82-06139 2E

A Conceptual Model of Primary Productivity in Shallow Streams Using Biomass Simulation,
W82-06153 5C

Simulating and Improving Hydro Plant Control,
W82-06202 8C

Simulation of Solute Transport Using a Transfer Function Model,
W82-06318 2G

Transpirational Supply and Demand: Plant, Soil, and Atmospheric Effects Evaluated by Simulation,
W82-06320 2D

Advanced Calibration Methodology for Hydrologic Rainfall - Runoff Simulation Models,
W82-06366 2A

Computer Simulation of Surface Irrigation by Means of Numerical Methods for Finding Optimal Parameters,
W82-06781 3F

SIRIO-SHF EXPERIMENT
A Rain Attenuation Model for the Sirio-Shf Experiment,
W82-06530 7B

SITE SELECTION
Selection of Waste disposal sites,
W82-06550 5E

Power Plant Siting,
W82-06555 6G

SLUDGE
Polychlorinated Biphenyl and Organochlorine Insecticide Concentrations in Forty Sewage Sludges in England,
W82-06081 5A

Sewage Sludge Pumping - Recent Research and Application,
W82-06258 5D

Environmental Residuals and Capital Costs of Energy Recovery from Municipal Sludge and Feedlot Manure,
W82-06405 5E

Impact of Pretreatment on Sludge Content of Heavy Metals,
W82-06461 5D

Heavy Metals in Sludge--Are Their Toxic Effects Additive,
W82-06646 5E

Electrokinetic Densification of Solids in a Coal Mine Sediment Pond- A Feasibility Study, (In Two Parts), 1. Laboratory and Field Tests,
W82-06960 5D

SLUDGE ANALYSIS
Comparison of Methods for Recovering Indigenous Viruses from Raw Wastewater Sludge,
W82-06890 5A

SLUDGE DIGESTION
Sludge Management: A Research Update,
W82-06007 5E

Modified Sludge Digestion with Improved Gas Yield (Modifizierte Schlammfaulung Mit Verbesserter Gasausbeute).
W82-06024 5D

Effect of Chemical Coagulation on Anaerobic Digestibility of Organic Materials,
W82-06039 5D

Design and Operation of Anaerobic Sludge Digestion Systems,
W82-06347 5D

Fate of Nitrogen in Aerobic Sludge Digestion,
W82-06455 5D

Fate of Pathogens in Thermophilic Aerobic Sludge Digestion,
W82-06772 5D

SLUDGE DISPOSAL
Sludge Management: A Research Update,
W82-06007 5E

A Cost-Effective System for the Aerobic Stabilization and Disposal of Waste Activated Sludge Solids,
W82-06046 5E

Sludge Tankering Economics - A Fresh Approach,
W82-06076 5E

Disposal of Sewage Sludge to Sea--Engineering Aspects,
W82-06286 5E

Effects on the Ecosystem of Sewage Sludge Disposal by Dumping from Ships,
W82-06287 5C

Bacterial Pollution of Marine Waters from the Disposal of Sewage and Sewage Sludge to Sea,
W82-06288 5B

Effects of Turbulent Suspension on Trajectories of Settling Particles,
W82-06289 5E

Effects on the Ecosystem of Sewage Sludge Disposal from a Pipeline,
W82-06290 5C

Technical Control of Sewage Sludge Disposal to Sea,
W82-06291 5E

Sludge Disposal to Sea in U.K.,
W82-06292 5E

Disposal of Sewage Sludge to Sea--Research Needs,
W82-06293 5E

Selection of a Sludge Handling Disposal System,
W82-06346 5E

A Look at Co-Disposal,
W82-06354 5E

Land Disposal of Sewage Sludge, A Summary of Research Results, 1972-1980,
W82-06377 5E

Potato and Corn By-Products Used as Cattle Feed,
W82-06488 5E

Ocean Dumping Battle Marches On,
W82-06490 5E

Landspreading of sludge in New York State,
W82-06557 5E

Ocean Dumping of Sludge Vs. the Alternatives,
W82-06590 5E

Control of Toxic Metals at Sewage Treatment Works,
W82-06592 5E

Sludge Disposal to Sea in France,
W82-06593 5E

Mathematical Model Investigation of Far-Field Transport of Ocean-Dumped Sewage Sludge Related to Remote Sensing,
W82-06594 5E

Disposal of Sludge to Sea,
W82-06595 5E

Sludge Disposal Strategy: A UK Viewpoint,
W82-06596 5E

Ocean Disposal Legislation in the United States,
W82-06597 5E

LIBRARY U. OF I., URBANA-CHAMPAIGN

Sludge Disposal to Sea: North American Viewpoint,
W82-06598 5E

Sludge Disposal to Sea in South Africa,
W82-06599 5E

Sludge Disposal to Sea in the Federal Republic of Germany,
W82-06600 5E

The Effect of Sewage Sludge Land Disposal on the Microbiological Quality of Groundwater,
W82-06767 5C

A Case for Regional Sludge Management,
W82-06993 5E

SLUDGE LAGOONS
Low-Cost Treatment of Wastewater,
W82-06506 5D

SLUDGE TREATMENT
Recovery of Zinc from Wastewater Treatment Sludge,
W82-06485 5E

SLUDGE VOLUME INDEX
Factors Affecting Flog Formation and Bulking in the Activated Sludge Process for Treatment of Textile Waste Waters,
W82-06171 5D

SLUG FLOW
Hydraulic Jump, Air Entrainment and Slug Flow in Bottom Outlets (Wechselsprung, Lufteintrag Und Schwallformiger Abfluss in Grundablassen),
W82-06244 8B

SLUICWAYS
Hydraulic Model Studies - Yellowtail Afterbay Dam Sluiceway,
W82-06962 8A

SLURRIES
Preliminary Studies on the Dewatering of Coal-Clay Waste Slurries Using a Flocculant,
W82-06958 5D

SMALL WATERSHEDS
Ground-Water Hydrology of Strip-Mine Areas in Eastern Ohio (Conditions During Mining of Two Watersheds in Coshocton and Muskingum Counties),
W82-06141 2F

Hydrology of Salt Wells Creek--A Plains Stream in Southwestern Wyoming,
W82-06679 2A

SNOW
Determination of Sulphur in Snow by Proton Induced X-Ray Emissions (Pixe) Method,
W82-06082 5A

SNOW PACK
The Importance of Refreezing on the Diurnal Snowmelt Cycle with Application to a Northern Swedish Catchment,
W82-05942 2C

SNOWMELT
The Importance of Refreezing on the Diurnal Snowmelt Cycle with Application to a Northern Swedish Catchment,
W82-05942 2C

An Operational Net Shortwave Radiation Model for Glacial Basins,
W82-06064 2C

Evaporation from the Surface of the Arctic Tundra on Axel Heiberg Island,
W82-06065 2D

Groundwater and Meltwater in the Snowmelt Induced Runoff,
W82-06198 2E

SNOWPACK
Colorado River Enhanced Snowpack Test Environmental Assessment and Design Phase Finding of No Significant Impact,
W82-06967 6G

SOIL ABSORPTION CAPACITY
Survival and Fate of Enteric Viruses in Soil Treatment Systems for Wastewater,
W82-06150 5D

SOIL ENVIRONMENT
Transpirational Supply and Demand: Plant, Soil, and Atmospheric Effects Evaluated by Simulation,
W82-06320 2D

Ecological Optimality in Water-Limited Natural Soil-Vegetation Systems 1. Theory and Hypothesis,
W82-06321 2I

Ecological Optimality in Water-Limited Natural Soil-Vegetation Systems 2. Tests and Applications,
W82-06322 2I

SOIL EROSION
A Benefit Cost Analysis of a Soil Erosion Control Program for the Northern Watershed of Lake Chicot, Arkansas,
W82-06170 4D

Erosion Control at a Delicate Highway Construction Site,
W82-06510 4D

Efffect of Cattle Manure on Soil Erosion by Water,
W82-06834 4D

Fire and Geomorphic Processes,
W82-06963 2J

SOIL LOSS
Controlling Agricultural Soil Loss in Arkansas' North Lake Chicot Watershed: A Cost Analysis,
W82-06796 4D

SOIL MECHANICS
Test and Control Programme for Twiste Dam Situated in Sandstone and with Restricted Extent of Sub-Surface Sealing (Mess- und Uberwachungsprogramm Einer Stauanlage im Buntsandstein bei Begrenzter Untergrundabdichtung am Beispiel der Twistetalsperre),
W82-06632 8D

SOIL MOISTURE
Soil Moisture Flow for Point and Line Sources - Computer Programs for Linearized Solutions,
W82-05928 2G

SOIL MOISTURE DEFICIENCY
Moisture Conservation of Interseeded Grasslands Through the Use of Annual and Perennial Crop Barriers,
W82-06148 3F

Water Stress of Four Windbreak Tree Species During Soil Drying,
W82-06793 2I

SOIL MOISTURE RETENTION
Estimating Soil Water Retention from Soil Properties,
W82-06332 2G

SOIL ORGANIC MATTER
Seasonal Variation of Infiltration Capacities of Soils in Western Oregon,
W82-06961 2G

SOIL POROSITY
Moisture and Heat Transport in Hysteretic, Inhomogeneous Porous Media: A Matric Head-Based Formulation and a Numerical Model,
W82-06857 2G

SOIL PROPERTIES
Estimating Soil Water Retention from Soil Properties,
W82-06332 2G

SOIL STABILIZATION
Efffect of Cattle Manure on Soil Erosion by Water,
W82-06834 4D

SOIL TEMPERATURE
Evaluating Near-Surface Soil Moisture Using Heat Capacity Mapping Mission Data,
W82-05956 7B

SOIL TYPES
Survival and Fate of Enteric Viruses in Soil Treatment Systems for Wastewater,
W82-06150 5D

SOIL WATER
Evaluating Near-Surface Soil Moisture Using Heat Capacity Mapping Mission Data,
W82-05956 7B

A Comparison of Three Infiltration Models,
W82-05965 2G

Vadose Zone Permeability Tests: Summary,
W82-06301 2G

Vadose Zone Permeability Tests: Steady State Results,
W82-06302 2G

Vadose Zone Permeability Tests: Unsteady Flow,
W82-06303 2G

Simulation of Solute Transport Using a Transfer Function Model,
W82-06318 2G

Analytical Solutions of the One-Dimensional Convective-Dispersive Solute Transport Equation,
W82-06408 2G

A Comparison of Numerical Solutions of the One-Dimensional Unsaturated Flow and Mass Transport Equations,
W82-06547 2G

An Empirical Method for Determining Average Soil Infiltration Rates and Runoff, Powder River Structural Basin, Wyoming,
W82-06692 2G

Infiltration Capacity Curves for Sodium Affected Soils,
W82-06712 3C

Consumptive Use of Water by Major Crops in the Southwestern United States,
W82-06964 3F

Aircraft Remote Sensing of Soil Moisture and Hydrologic Parameters, Chickasha, Okla., 1980 Report,
W82-06969 7B

SOIL-WATER-PLANT RELATIONSHIPS
Effects of Irrigation Frequency on Germination and on Root and Shoot Yields of Acacia Species,
W82-06229 2I

SOIL WATER TABLE
Effect of Water Management and Bed Height on Sugarcane Yield,
W82-06231 2I

SOLAR ASSISTED DESALINATION
Critical Analysis of a Proposed Solar Assisted HTE Desalination System,
W82-06121 3A

SOLID WASTE DISPOSAL
Sludge Tankering Economics - A Fresh Approach,
W82-06076 5E

SOLID WASTES
Solid Wastes and Water Quality,
W82-06929 5B

SOLUTE TRANSPORT
Diffusive and Hydraulic Transfer of Solutes Through Homogeneous Membranes,
W82-06006 5F

Analytical Solutions of the One-Dimensional Convective-Dispersive Solute Transport Equation,
W82-06408 2G

A Comparison of Numerical Solutions of the One-Dimensional Unsaturated Flow and Mass Transport Equations,
W82-06547 2G

An Upstream Finite Element Method for Solution of Transient Transport Equation in Fractured Porous Media,
W82-06858 2F

SOLUTES
Simulation of Solute Transport Using a Transfer Function Model,
W82-06318 2G

A Field Test of the Transfer Function Model for Predicting Solute Transport,
W82-06339 2G

SONAR
Hydroacoustic Assessment of Pelagic Fish Stocks: A Potential New Management Tool,
W82-06373 8I

SONIFICATION
The Influence of Phytoplankton Composition on the Relative Effectiveness of Grinding and Sonification for Chlorophyll Extraction,
W82-06902 5A

SORPTION
Derivation of an Empirical Sorption Rate Equation by Analysis of Experimental Data,
W82-06664 5D

SOUND WAVES
Kinetics of Compressibility in Two-Phase Fluid Flows,
W82-05910 1A

Hydroacoustic Assessment of Pelagic Fish Stocks: A Potential New Management Tool,
W82-06373 8I

SOUTH AFRICA
Lessons Learned from the 1981 Laingsburg Flood,
W82-05997 2E

Design Technique Development for Dams in South Africa,
W82-06011 8A

Metal Surveys in South African Estuaries: III. Hartenbos, Little Brak and Great Brak Rivers,
W82-06387 5B

Sludge Disposal to Sea in South Africa,
W82-06599 5E

Synthesis of Streamflow Information Relating to the Semi-Arid Karoo Biome of South Africa,
W82-06835 4A

SOUTH CAROLINA
Rice Fields of South Carolina: A Resource Inventory and Management Policy Evaluation,
W82-06072 6B

Final Environmental Impact Statement; Defense Waste Processing Facility, Savannah River Plant, Aiken, S.C.
W82-06087 6G

Ground Water Quality and Quantity in Fracture Zones in the Piedmont of Northwestern South Carolina,
W82-06309 4B

Factors Affecting Depth Distribution of Dragonflies and Other Benthic Insects in a Thermally Destabilized Reservoir,
W82-06899 5C

SOUTHWEST U.S
Consumptive Use of Water by Major Crops in the Southwestern United States,
W82-06964 3F

SOYBEAN
A Salt and Water Balance Model for Silt Loam Soil Cropped to Rice and Soybean,
W82-06172 2G

SPATIAL DISTRIBUTION
Variations in Moisture Deficits over the Maize-Growing Region of South Africa I. Spatial Aspects,
W82-05901 2B

On the Relationship Between Kriging and State Estimation,
W82-06323 7C

Spatial Coherence of Monthly Precipitation in the United States,
W82-06894 2B

SPAWNING GRAVEL
A New Method for Reporting and Interpreting Textural Composition of Spawning Gravel,
W82-06395 8I

SPECIES COMPOSITION
Structure and Dynamics of Zooplankton Communities in the Littoral Zone of Some North Carolina Lakes,
W82-06911 5C

SPECIES DIVERSITY
Vegetation Structure and Diversity Components of a Fraser Estuary Tidal Marsh,
W82-06465 2L

Vegetation-Environment Relations in a Brackish Marsh, Lulu Island, Richmond, B.C.,
W82-06497 2L

SPECIFIC HUMIDITY
Autocorrelations of Moisture Parameters on Isentropic Surfaces,
W82-06210 2B

SPECIFICATIONS
Material Specification and the Availability and Life of Desalination Equipment in Both Saudia Arabia and the Arabian Gulf,
W82-06126 3A

SPECTRAL ANALYSIS
A Remote Sensing Technique for Estimating Watershed Runoff,
W82-06151 7C

SPECTROPHOTOMETRY
The Effect of Metal Ions on the Ultraviolet Spectra of Humic Acid, Tannic Acid and Lignosulfonic Acid,
W82-06273 2K

SPECTROSCOPY
Inorganics,
W82-06999 5A

SPILLWAYS
Investigation of the Overflow Spillway of the Velishchai Reservoir,
W82-06220 8A

Design Flood and Hydrological Risk for Spillways or Reservoirs and Flood Protection Basins (Bemessungshochwasser Und Hydrologisches Versagensrisiko Fur Talsperren Und Hochwasserruckhaltebecken),
W82-06238 8B

SPLASH EROSION
Splash Erosion Modeling: Physical Analysis,
W82-05970 2J

SPOIL BANKS
Consequences of Contamination by Heavy Metals in Tidal Estuaries by the Example of the River Elbe (Auswirkungen der Schwermetallbelastung von Tidegewassern am Beispiel der Elbe),
W82-06637 5E

SPRINGS
A Faunal Analysis of the Springs off the Ouachita Mountains, Arkansas,
W82-06161 2K

Characterization of Laverkin Springs Water and Methods for Its Reuse in Energy Development,
W82-06400 5G

SPRINKLER IRRIGATION
Sprinkler Leveler and Wind Compensating Device,
W82-06164 3F

Responses of 6-Year-Old Diamond Grapevines to the Change from Sprinkler to Trickle Irrigation and to the Time and Method of Applying Nitrogen,
W82-06492 3F

Automation of a Sprinkler Irrigation System by the Utilization of Real Time Weather Information,
W82-06695 3F

SRI LANKA
Infiltration Rates of Rainwaters in Sri Lanka Measured by Using Tritium Tracer,
W82-05941 2F

Planning Sri Lanka's Victoria Scheme,
W82-05979 8A

Confluence of Two Jets Created by Two Parallel Segment Gates of a Bottom Outlet (Schussstrahl-Zusammenfuhrung Bei Einem Grundablass Mit Nebeneinyanderliegenden Segmentschutzen).
W82-06243 8B

SRICSI METHODOLOGY
Evaluation of the Stream Reach Inventory and Channel Stability Index for Instream Habitat Analysis,
W82-06308 4D

ST. CROIX RIVER
Dissolved Oxygen Modelling of the St. Croix River, Maine - New Brunswick,
W82-06572 5B

ST. LAWRENCE ESTUARY
Variability of Temperature, Salinity and Tidally-Averaged Density in the Middle Estuary of the St. Lawrence,
W82-06533 2L

ST. LAWRENCE RIVER
Discharge of Metals from the St. Lawrence River,
W82-06190 5B

STABILIZATION PONDS
A Survey of Aerated Lagoon Performance,
W82-06391 5D

LIBRARY U. OF I., URBANA-CHAMPAIGN

Ammonia Nitrogen Removal in Facultative Wastewater Stabilization Ponds,
W82-06454 5D

Nitrogen Dynamics in Waste Stabilization Ponds,
W82-06456 5D

Low-Cost Treatment of Wastewater,
W82-06506 5D

STABLE CHANNEL
Origin of Step-Pool Systems in Mountain Streams,
W82-06335 2J

STANDARD PLATE COUNT
Analytical Note: Evaluation of the m-SPC Method as a Substitute for the Standard Plate Count in Water Microbiology,
W82-06280 5F

STANDARDS
Impact of Thermal Standards on Power Plant Water Consumption,
W82-06057 5G

STANDING CROPS
Moisture Conservation of Interseeded Grasslands Through the Use of Annual and Perennial Crop Barriers,
W82-06148 3F

Determination of the Number of Respiring Thiobacillus Ferrooxidans Cells in Water Samples by Using Combined Fluorescent Antibody-2-(p-Iodophenyl)-3-(p-Nitrophenyl)-5-Phenyltetrazolium Chloride Staining,
W82-06542 5A

STATE ESTIMATION
On the Relationship Between Kriging and State Estimation,
W82-06323 7C

Modelling of the Activated Sludge Process for Microprocessor-Based State Estimation and Control,
W82-06324 5D

STATE JURISDICTION
Ground Water and the States,
W82-06297 6E

STATISTICAL ANALYSIS
Reliability Analysis of BOD Kinetics in a Southern Stream Governed by the Discharge of an Oxidation Pond,
W82-06159 5B

On the Relationship Between Kriging and State Estimation,
W82-06323 7C

Stochastic Trigger Model for Flood Peaks 1. Development of the Model,
W82-06325 2E

Stochastic Trigger Model for Flood Peaks 2. Application of the Model to the Flood Peaks of Goksu-Karahacili,
W82-06326 2E

Objective Analyses and Mapping Techniques for Rainfall Fields: An Objective Comparison,
W82-06327 2B

STATISTICAL METHODS
Statistical Sampling Technique for Controlling the Accuracy of Small Water Meters,
W82-06350 6C

STATISTICAL STUDIES
A Statistical-Dynamical Climate Model with a Simple Hydrology Cycle,
W82-06838 2B

STATISTICS
Albedo Survey on Andrei Glacier, Iskut River Basin, B. C., Midsummer, 1980,
W82-06578 2C

STEADY FLOW
A Steady State Model for Buoyant Surface Plume Hydrodynamics in Coastal Waters,
W82-06837 2L

STEAMBOAT SPRINGS
Helium Isotopes in Geothermal Systems: Iceland, The Geysers, Raft River and Steamboat Springs,
W82-06085 2F

STEEL INDUSTRY
Beneficial Disposal of Pickle Liquor,
W82-06486 5D

Steel Industry Wastes,
W82-06799 5D

STOCHASTIC HYDROLOGY
Advanced Calibration Methodology for Hydrologic Rainfall - Runoff Simulation Models,
W82-06366 2A

STOCHASTIC MODELS
Models of Annual Cycles in Lentic Water Bodies,
W82-06483 5G

STOCHASTIC PROCESS
Stochastic Trigger Model for Flood Peaks 2. Application of the Model to the Flood Peaks of Goksu-Karahacili,
W82-06326 2E

Stochastic Generation of Monthly Streamflows,
W82-06427 4A

A Univariate Versus a Multivariate Parameter Distribution in a Stochastic-Conceptual Analysis of Unsaturated Flow,
W82-06856 2G

STORAGE EQUATION
A Discrete System Storage Model for Analyzing Rainfall-Runoff Relationships,
W82-06219 2A

STORAGE RESERVOIRS
Some Geotechnical Aspects of the Construction of the 'Safety Reservoir Broechem',
W82-06012 8A

STORM DRAINS
Bicycle-Safe Grate Inlets Study; Volume 5 - Hydraulic Design of General Slotted Drain Inlets,
W82-06095 8B

STORM-OVERFLOW SEWERS
Detroit-Style CSO Studies,
W82-06247 5G

The Impact of Combined Sewer Overflows on the Dissolved Oxygen Concentration of a River,
W82-06316 5C

Flow Control at Stormwater Overflows and Stormwater Tanks (Abflusssteuerung von Regenwasserbehandlungsanlagen),
W82-06633 8C

An Overview of the U.S. Environmental Protection Agency's Storm and Combined Sewer Program Collection System Research,
W82-06775 5G

STORM RUNOFF
Reduction of Urban Runoff Through Economic Incentives: Boulder, Colorado,
W82-06629 4C

Quality of Stormwater Runoff from Motorways (Diebeschaffenheit der Niederschlagsabflusse von Autobahnen),
W82-06635 5B

Hydrologic Data for Urban Studies in the San Antonio, Texas Metropolitan Area, 1978,
W82-06672 7C

STORM WASTEWATER
Detroit-Style CSO Studies,
W82-06247 5G

Flow Control at Stormwater Overflows and Stormwater Tanks (Abflusssteuerung von Regenwasserbehandlungsanlagen),
W82-06633 8C

Investigations on Loading and Quality of Discharge of Municipal Sewage Treatment Plants in the Case of Stormwater Inflow (Utersuchungen Uber Belastung Und Ablaufbeschaffenheit Kommunaler Klaranlagen Bei Mischwasserzufluss),
W82-06634 5D

Decontamination of Overland Runoff from Populated Areas,
W82-06980 5D

STORM WATER
Storm Related Dilution of Conductance in Three Hydrologically Different Water Bodies,
W82-06067 5B

Regional Detention Basins for Stormwater Control,
W82-06225 8A

The Impact of Combined Sewer Overflows on the Dissolved Oxygen Concentration of a River,
W82-06316 5C

Physical-Chemical Treatment and Disinfection of Stormwater,
W82-06389 5G

Evaluation of Effects of Stormwater Detention in Urban Areas,
W82-06698 5G

Stormwater Management in a Sensitive Area.
W82-06841 5G

Storm Water Runoff Quality From Three Land-Use Areas in South Florida,
W82-06877 5B

Urban Runoff and Combined Sewer Overflow,
W82-06914 5D

STORMS
On Accumulation of Water Substance in a Column of Rising Air,
W82-06581 2B

STRATIFICATION
Vertical Movements of the Surface Water and Thermal Stratification in Rutland Water,
W82-06476 2H

STRATIGRAPHIC DISTRIBUTION
Some Paleolimnological Aspects of the Most Recent Sediments of Lac Laflamme (Laurentides Provincial Park, Quebec) in Relation to Atmospheric Transportation of Pollutants,
W82-06577 5A

STREAM DEGRADATION
Mathematical Model for Erodible Channels,
W82-06336 2J

STREAM DISCHARGE
Effects of Reduced Stream Discharge on Fish and Aquatic Macroinvertebrate Populations,
W82-05923 6G

Generation of Weekly Streamflow Data for a Large Hydrological System-An Autoregressive

Multivariate Multi-Lag-Model(Simulation Wochentlicher Abflusse fur Ein Grossraumiges Hydrologisches System-Ein Autoregressives, Multivariates Multi-Lag-Modell-),
W82-06826 4A

STREAM EROSION
Mathematical Model for Erodible Channels,
W82-06336 2J

STREAM IMPROVEMENT
Stream Rehabilitation Following Treatment for Phosphorus Removal: Pre-Treatment Assessment,
W82-05919 5G

STREAM STABILIZATION
Habitat Recovery in the North Fork of the Teton River.
W82-06409 6G

STREAM UPFLOW
Environmental Impact of Upland Streams on the Okefenokee Swamp,
W82-05933 5B

STREAMBEDS
Origin of Step-Pool Systems in Mountain Streams,
W82-06335 2J

Lower Flow Regime Bedforms: Rational Classification,
W82-06421 2E

Decrease in Stream Gravel Permeability After Clear-Cut Logging: An Indication of Intragravel Conditions for Developing Salmonid Eggs and Alevins,
W82-06910 5C

STREAMFLOW
A Stochastic Streamflow Model of the Platte River at Overton, Odessa, and Grand Island, Nebraska,
W82-06139 2E

Dispersion in Mountainous Natural Streams,
W82-06357 2E

Digitizing and Routine Analyses of Hydrological Data,
W82-06386 2E

Stochastic Generation of Monthly Streamflows,
W82-06427 4A

Summary of Basin and Flood Characteristics for Unregulated Basins in New Mexico,
W82-06671 7C

An Assessment of Streamflow, Water Quality, and the Effects of Constructing an Impoundment on Bridge Creek at Augusta, Wisconsin,
W82-06677 2E

Flow Characteristics and Water-Quality Conditions in the Spokane River, Coeur d'Alene Lake to Post Falls Dam, Northern Idaho,
W82-06681 5B

Synthesis of Streamflow Information Relating to the Semi-Arid Karoo Biome of South Africa,
W82-06835 4A

Floodflow Characteristics of Honcut Creek at State Highway 70 Bridges Near Live Oak, California,
W82-06945 4A

Hydrologic and Morphologic Changes in Channels of the Platte River Basin: A Historical Perspective,
W82-06946 2E

STREAMFLOW FORECASTING
Finite Element Modeling of Streamflow Routing,
W82-05918 2E

Adaptive Real-Time Streamflow Forecasting Model for Hydrosystem Operational Planning,
W82-05926 2E

The Use of River Flow Data to Predict Low Flows as an Aid to Trout Farm Management,
W82-06083 2E

STREAMS
A Conceptual Model of Primary Productivity in Shallow Streams Using Biomass Simulation,
W82-06153 5C

Reliability Analysis of BOD Kinetics in a Southern Stream Governed by the Discharge of an Oxidation Pond,
W82-06159 5B

The White Clay Creek Project: A Prototype Strategy for Protecting Small Stream Valleys.
W82-06368 6B

Fact Finding Hearing - Cottonwood Creek Instream Beneficial Use Program,
W82-06522 6B

Ecology of Streams Draining Forested and Non-Forested Catchments in an Area of Central Scotland Subject to Acid Precipitation,
W82-06909 5C

STREETER-PHELPS EQUATIONS
Nomographs for Rapid Solutions for the Streeter-Phelps Equations,
W82-06460 5B

STREPTOCOCCI
A Water Quality Index for Lake Beaches,
W82-06660 5G

STRIP MINES
Ground-Water Hydrology of Strip-Mine Areas in Eastern Ohio (Conditions During Mining of Two Watersheds in Coshocton and Muskingum Counties),
W82-06141 2F

STROMATOLITES
Modern Lacustrine Stromatolites, Walker Lake, Nevada,
W82-06934 5C

STRONTIUM RADIOISOTOPES
Radionuclides in Dardanelle Lake in the Area of the Nuclear I Facility: 1979-1981,
W82-06169 5B

SUBSIDENCE
Quantitative Relationships Between Numbers of Fluvial Cycles, Bulk Lithological Composition and Net Subsidence in a Scottish Namurian Basin,
W82-05959 2J

SUBSIDIES
An Economic Comparison of the Irrigation of Corn in Humid and Arid Regions of the United States,
W82-05909 6B

SUBSOIL
The Annabrucke River Power Station on the Drau, Constructions Taken to Prevent Erosion in the Vicinity of the Barrage on an Exceptional Subsoil (Das Draukraftwerk Annabrucke, Massnahmen zur Verhinderung der Erosion in Bereich Des Bauwerkes auf Aussergewohnlichem Untergrund),
W82-06636 8E

SUBSURFACE DRAINAGE
Subsurface Drainage Effects on Erosion,
W82-06795 4D

SUCCESSION
Rutland Water Phytoplankton: The Development of an Asset or a Nuisance,
W82-06473 2H

Vegetation-Environment Relations in a Brackish Marsh, Lulu Island, Richmond, B.C.,
W82-06497 2L

SUDAN
Evaluation of Groundwater Resources in Tokar Delta, Sudan,
W82-06197 2E

Microbiological Examination of Sebeel Water,
W82-06882 5C

SUGARCANE
Effect of Water Management and Bed Height on Sugarcane Yield,
W82-06231 2I

SULFATE-REDUCING BACTERIA
Kinetic Analysis of Competition Between Sulfate Reducers and Methanogens for Hydrogen in Sediments,
W82-06886 2H

SULFATE REDUCTION
Sulfate Reduction and Methanogenesis in the Sediment of a Saltmarsh on the East Coast of the United Kingdom,
W82-06541 2L

SULFIDES
Determination of Sulphide in Industrial Waste Waters and Sewage Waters with an Iodide-Selective Electrode,
W82-06192 5A

Controlling Sulfides and Odors in Sewers, Part One,
W82-06509 5D

SULFUR
Influence of Ozonation on Sulfur, Nitrogen, Chloride and Phosphorus Systems in Public Drinking Water Supplies,
W82-05907 5F

Determination of Sulphur in Snow by Proton Induced X-Ray Emissions (Pixe) Method,
W82-06082 5A

SULFUR CYCLE
Comparative Aspects of Sulfur Mineralization in Sediments of a Eutrophic Lake Basin,
W82-06888 5C

SUMPS
Pump Sump Design Experience: Summary,
W82-06419 8C

SUPERSATUATION
Hydraulic Model Studies - Yellowtail Afterbay Dam Sluiceway,
W82-06962 8A

SUPPLEMENTAL IRRIGATION
Sizing Farm Reservoirs for Supplemental Irrigation of Corn. Part I: Modeling Reservoir Size Yield Relationships,
W82-05967 2I

SURFACE-GROUNDWATER RELATIONS
Daily Operational Tool for Maximum Beneficial Use Management of Surface and Ground Waters in a Basin,
W82-06174 4B

Hydrology and Model of North Fork Solomon River Valley, Kirwin Dam to Waconda Lake, North-Central Kansas,
W82-06684 2A

SURFACE-GROUNDWATER RELATIONSHIPS
Artificial Recharge of Colorado River Water in Las Vegas Valley: Management Options and Potential Aquifer System Responses,
W82-06694 6B

LIBRARY U. OF I., URBANA-CHAMPAIGN

SURFACE IRRIGATION
A Kinematic Model for Surface Irrigation: An Extension,
W82-06852 3F

SURFACE RUNOFF
Herbicide Loss in Runoff Water and Sediment as Affected by Center Pivot Irrigation and Tillage Treatments,
W82-05921 5B

Environmental Impact of Upland Streams on the Okefenokee Swamp,
W82-05933 5B

Geomorphic and Lithologic Controls of Diffuse-Source Salinity, Grand Valley, Western Colorado,
W82-06364 2J

Advanced Calibration Methodology for Hydrologic Rainfall - Runoff Simulation Models,
W82-06366 2A

An Empirical Method for Determining Average Soil Infiltration Rates and Runoff, Powder River Structural Basin, Wyoming,
W82-06692 2G

Land Water Interactions: Effects of Introduced Nutrients and Soil Particles on Reservoir Productivity,
W82-06710 2J

SURFACE SEALING
A Comparison of Three Infiltration Models,
W82-05965 2G

SURFACE WATER
Water Quality and Hydrology in a Coastal Region of the Netherlands,
W82-06103 5B

Water Resources of the Ochlockonee River Area, Northwest Florida,
W82-06132 2A

Statistical Summaries of Streamflow and Water-Quality Data for Streams of Western North Dakota, 1977-80,
W82-06133 7C

Water Resources Data for Oregon, Water Year 1980--Volume 2. Western Oregon.
W82-06143 7C

San Juan River Basin,
W82-06144 7C

Daily Operational Tool for Maximum Beneficial Use Management of Surface and Ground Waters in a Basin,
W82-06174 4B

Water Resources Data for Tennessee, Water Year 1980.
W82-06670 7C

Water-Resources Investigations of the U. S. Geological Survey in Arkansas--Fiscal year 1981.
W82-06673 7C

Water Resources Data, Louisiana, Water Year 1981--Volume 1. Central and Northern Louisiana.
W82-06674 7C

Hydrologic and Morphologic Changes in Channels of the Platte River Basin: A Historical Perspective,
W82-06946 2E

Water Resources Data for Alabama, Water Year 1980--Volume 1. Apalachicola, Choctawatchee, Blackwater, Escambia, Perdido, and Alabama River Basins,
W82-06953 7C

Water Resources Data for Alabama, Water Year 1980--Volume 2. Tombigbee, Mobile, Dog, Pascagoula, and Tennessee River Basins,
W82-06954 7C

Water Resources Data for Florida, Water Year 1980--Volume 2A. South Florida Surface Water,
W82-06955 7C

Water Resources Data for Oregon, Water Year 1980--Volume 1. Eastern Oregon.
W82-06957 7C

SURVEYS
The Impact of Mass Distribution of Water Conservation Devices and a Water Conservation Rate Structure on Residential Water Use,
W82-06155 3D

Non-Point Source Pollution: Directions for Vermont,
W82-06372 5G

SUSPENDED SEDIMENTS
Colorado Cooperative Fishery Research Unit Studies at Twin Lakes, Colorado: 1980 Report of Findings,
W82-06402 6G

Suspended Sediment in a Wave Field,
W82-06527 2J

Effects of Suspended Volcanic Sediment on Coho and Chinook Salmon in the Toutle and Cowlitz Rivers,

SYMPOSIUM
Numerical Methods in Hydraulics,
W82-06614 8B

SYNTHESIS
The Development of Dry-RO Membranes from Cellulosis and Noncellulosis Polymers Bearing Quaternary Ammonium Groups,
W82-06152 3A

SYNTHETIC FUELS
Synthetic Fuel Effluents,
W82-06800 5D

SYSTEMATICS
An Introductory Study of Seasonal Variation in the Aerobic Heterotrophic Bacterial Population of the Saint John River Using Classical Systematics,
W82-06559 5A

SYSTEMS ANALYSIS
Qualitative Stability Analysis of Geologic Systems, with an Example from River Hydraulic Geometry,
W82-06717 2E

Systems Analysis,
W82-06997 5G

TANNIC ACIDS
The Effect of Metal Ions on the Ultraviolet Spectra of Humic Acid, Tannic Acid and Lignosulfonic Acid,
W82-06273 2K

TATLOCKIA
Isolation of Pittsburgh Pneumonia Agent from a Hospital Shower,
W82-06891 5B

TAXONOMY
Bacteria Under the Ice,
W82-06561 5A

Seasonal and Diurnal Changes in the Predominant Heterotrophic Bacterial Species of the Meduxnekeag River,
W82-06562 5A

TECHNOLOGY TRANSFER
Desalination Directory 1981.
W82-05908 3A

TELEMETRY
Two Techniques for Locating and Sampling Brown Trout Microhabitat Under Complete Ice Cover,
W82-06703 7B

Comparison of Automated Satellite Systems with Conventional Systems for Hydrologic Data Collection in West-Central Florida,
W82-06951 7B

TEMPERATURE
Variability of Temperature, Salinity and Tidally-Averaged Density in the Middle Estuary of the St. Lawrence,
W82-06533 2L

TEMPERATURE EFFECTS
Influence of Temperature and Time of Incubation on the Estimation of Bacterial Numbers in Tropical Surface Waters,
W82-06037 5A

The Influence of Transient Temperature Changes on the Biodegradation of Nitrilotriacetic Acid in the Activated Sludge Process,
W82-06193 5D

Determination of Reaction Rate Constant and Temperature Coefficient Constant for Dadar Sewage, Bombay,
W82-06438 5D

Recovery of Protein and Oil from Fishery Bloodwater Waste, Effect of pH and Temperature,
W82-06655 5D

TENNESSEE
Water Resources Data for Tennessee, Water Year 1980.
W82-06670 7C

Biotransformation of PCB by Natural Assemblages of Freshwater Microorganisms,
W82-06719 5B

TERBUTRYN
Degradation of Terbutryn in Sediments and Water Under Various Redox Conditions,
W82-06790 5B

TERTIARY WASTEWATER TREATMENT
Experimental Data About Waste-Water Tertiary Treatment with Ozone,
W82-06257 5D

Application of Ultraviolet Disinfection in a Tertiary Wastewater Treatment Plant,
W82-06390 5D

Application of Ozone to Eliminate Tertiary Treatment of Wastewater Used for Industrial Cooling,
W82-06709 5F

TEST WELLS
On Conducting the Modified 'Slug' Test in Tight Formations,
W82-06060 8B

Summary of Hydrologic Testing in Tertiary Limestone Aquifer, Tenneco Offshore Exploratory Well--Atlantic OCS, Lease-Block 427 (Jacksonville NH 17-5),
W82-06685 2F

Data from Geothermal Test Wells Near Mount Hood, Oregon,
W82-06950 7A

TESTING PROCEDURES
Ames Salmonella Mutagenicity Assays on Water: Dichloromethane Extracts Versus Preparation of Growth Media with Test Samples,
W82-06548 5A

TETRAZOLIUM
Tetrazolium Reduction-Malachite Green Method for Assessing the Viability of Filamentous Bacteria in Activated Sludge,
W82-06752 5D

TEXAS
Common Facility Treatment of Industrial Wastewaters,
W82-05974 5D

Olmos Dam Modification.
W82-06186 8A

Hydrologic Data for Urban Studies in the San Antonio, Texas Metropolitan Area, 1978,
W82-06672 7C

Watertight Manholes Cut Inflow.
W82-06844 5G

Development of a Method for Detection of Human Rotavirus in Water and Sewage,
W82-06885 5A

Comparative Photoheterotrophy, Chemoheterotrophy, and Photolithotrophy in a Eutrophic Reservoir and an Oligotrophic Lake,
W82-06978 2H

TEXAS HIGH PLAINS
Economic Effect of Energy Price and Economic Feasibility and Potential of New Technology and Improved Management for Irrigation in Texas,
W82-06374 3F

TEXTILE MILL WASTES
Factors Affecting Flog Formation and Bulking in the Activated Sludge Process for Treatment of Textile Waste Waters,
W82-06171 5D

Esholt--Past, Present and Future,
W82-06653 5D

Textile Wastes,
W82-06916 5D

TFM
A Rapid High-Performance Liquid-Chromatographic Method for Simultaneously Determining the Concentrations of TFM and Bayer 73 in Water During Lampricide Treatments,
W82-06495 5A

THAILAND
Water Supply Development in Thailand.
